

20260308 Need more tests around ArIII

I use `MDEG` = 23 and still mask the 6900 – 7300Å window but keep 7100 – 7200Å open for [Ar III] but the bump under H α and [S II] is back.

As for the annoying second bump at 7100 ~ 7150Å (just before the Argon line) that affects the first bump, it is still there even we do `MDEG=50` overfitting.

So looks like this second bump is unavoidable and we should find a better masking region. Now I am testing another mask with $6900 - 7130\text{\AA}$ and $7200 - 7300\text{\AA}$ to see if any improvements.

I will also look at the sky spectrum to determine our skyline spectral mask $> 7000\text{\AA}$.
