

20251008rMZR in HII But No NGC4383 (redo for 14 bins)

Note.

1. Try removing the abnormal NGC4383. The reason is that it almost occupies the entire independent parameter space in rMZR. So if we want to study the SFR dependence in rMZR, it will be biased by this single galaxy. Therefore, we can try removing it and see how the results change.
2. Only spaxels from HII regions are included.
3. Update to 14 Σ_{SFR} bins, with binwidth 0.25 dex
4. Stick with these 4 indicators: D16, PG16, O3N2-M13 and O3N2-C20.

Summary:

Let's focus on O3N2 first (third and fourth rows).

Kind of different SFR dependence in rMZR, maybe due to that indicators are more dependent on O abundance or N abundance?

1. For D16 and PG16: higher Σ_{SFR} at higher metallicity up to at least $\Sigma_* \lesssim 8.5$.
2. For both O3N2, we can see there is an inversion point at $\Sigma_* \sim 7.8$ (lower metallicity shows higher Σ_{SFR} in low mass end; while metallicity positive-correlates with Σ_{SFR} in high mass end).

For individual galaxy, based on their positions in Z - Σ_* space of HII spaxels, they can be separated into the following 4 classes: "low" (primarily less than the vertical line at $\Sigma_* = 7.8 M_\odot/\text{kpc}^2$), "both" (sitting across the line) and "high" (primary high than the line), or "few" (no enough spaxels to tell the position).

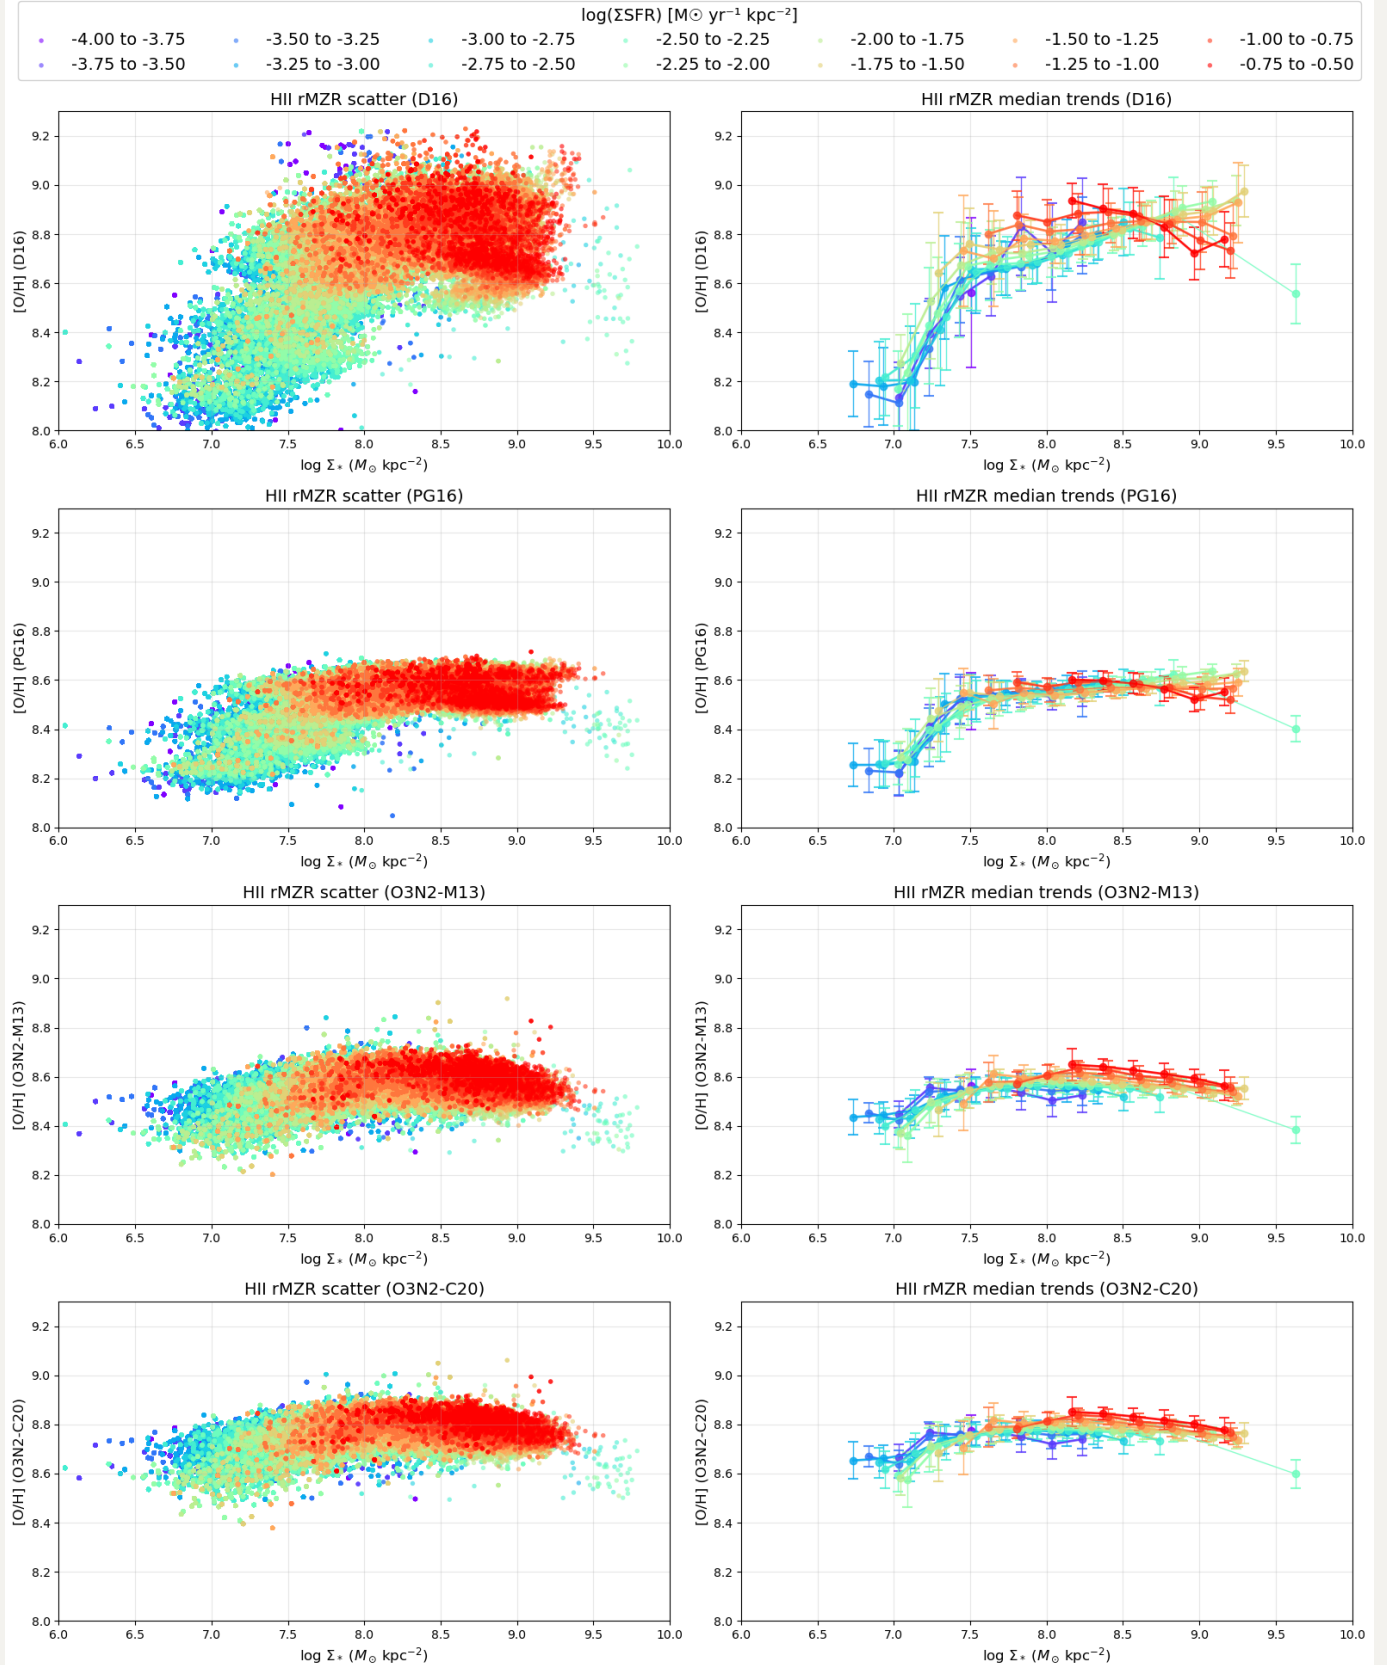

And in other way, based on the correlation between Z and Σ_{SFR} at fixed M_* , they can be also separated into 3 classes if they are not "few": "positive", "negative" or "inverse" ("negative" in low mass end while "positive" in high mass end, with inversion point at $\Sigma_* \sim 7.8 M_\odot/\text{kpc}^2$).

Thus, we have the following table (* are those "abnormalities" in rMZR, together with the removed NGC4383):

ID	POSITION	CORRELATION	EXPECTATION
IC3392	High	Positive	Yes
NGC4064	High	Positive	Yes
NGC4192	Cross	Inverse	Yes
NGC4293	Few (High?)	-	-
NGC4298	Cross	Positive (mostly?)	No?
NGC4330*	Low	Negative	Yes
NGC4396*	Low	Negative	Yes
NGC4419	High	Positive	Yes
NGC4457	Few (High?)	-	-
NGC4501	Cross	Positive	No
NGC4522*	Low	- (Positive?)	No?
NGC4694*	High	Positive	Yes
NGC4698	Few (Cross?)	-	-

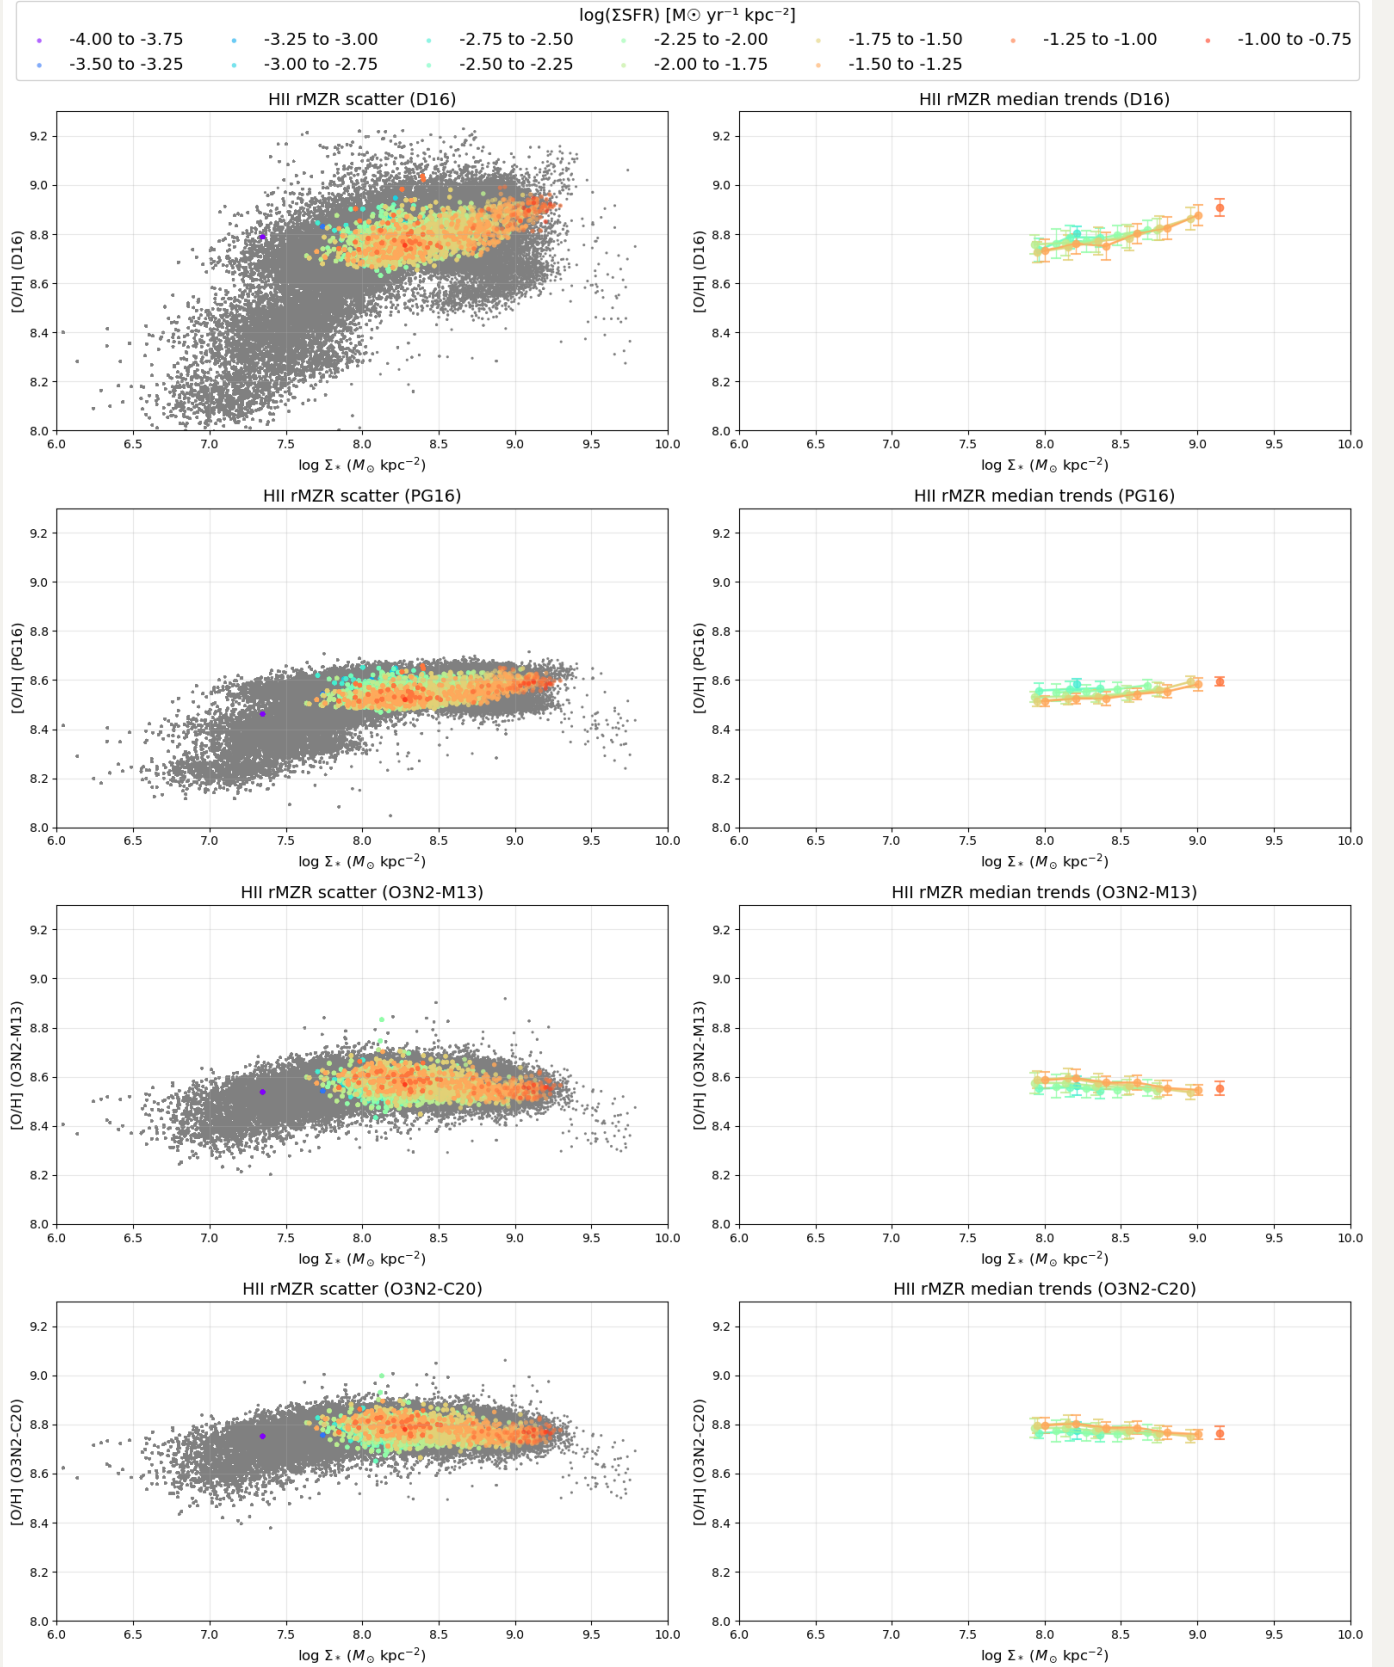

Combined

rMZR behavior in Σ_{SFR} bins: HII regions only, No {'NGC4383'} (Min 20 datapoints, Adjacent bins only)

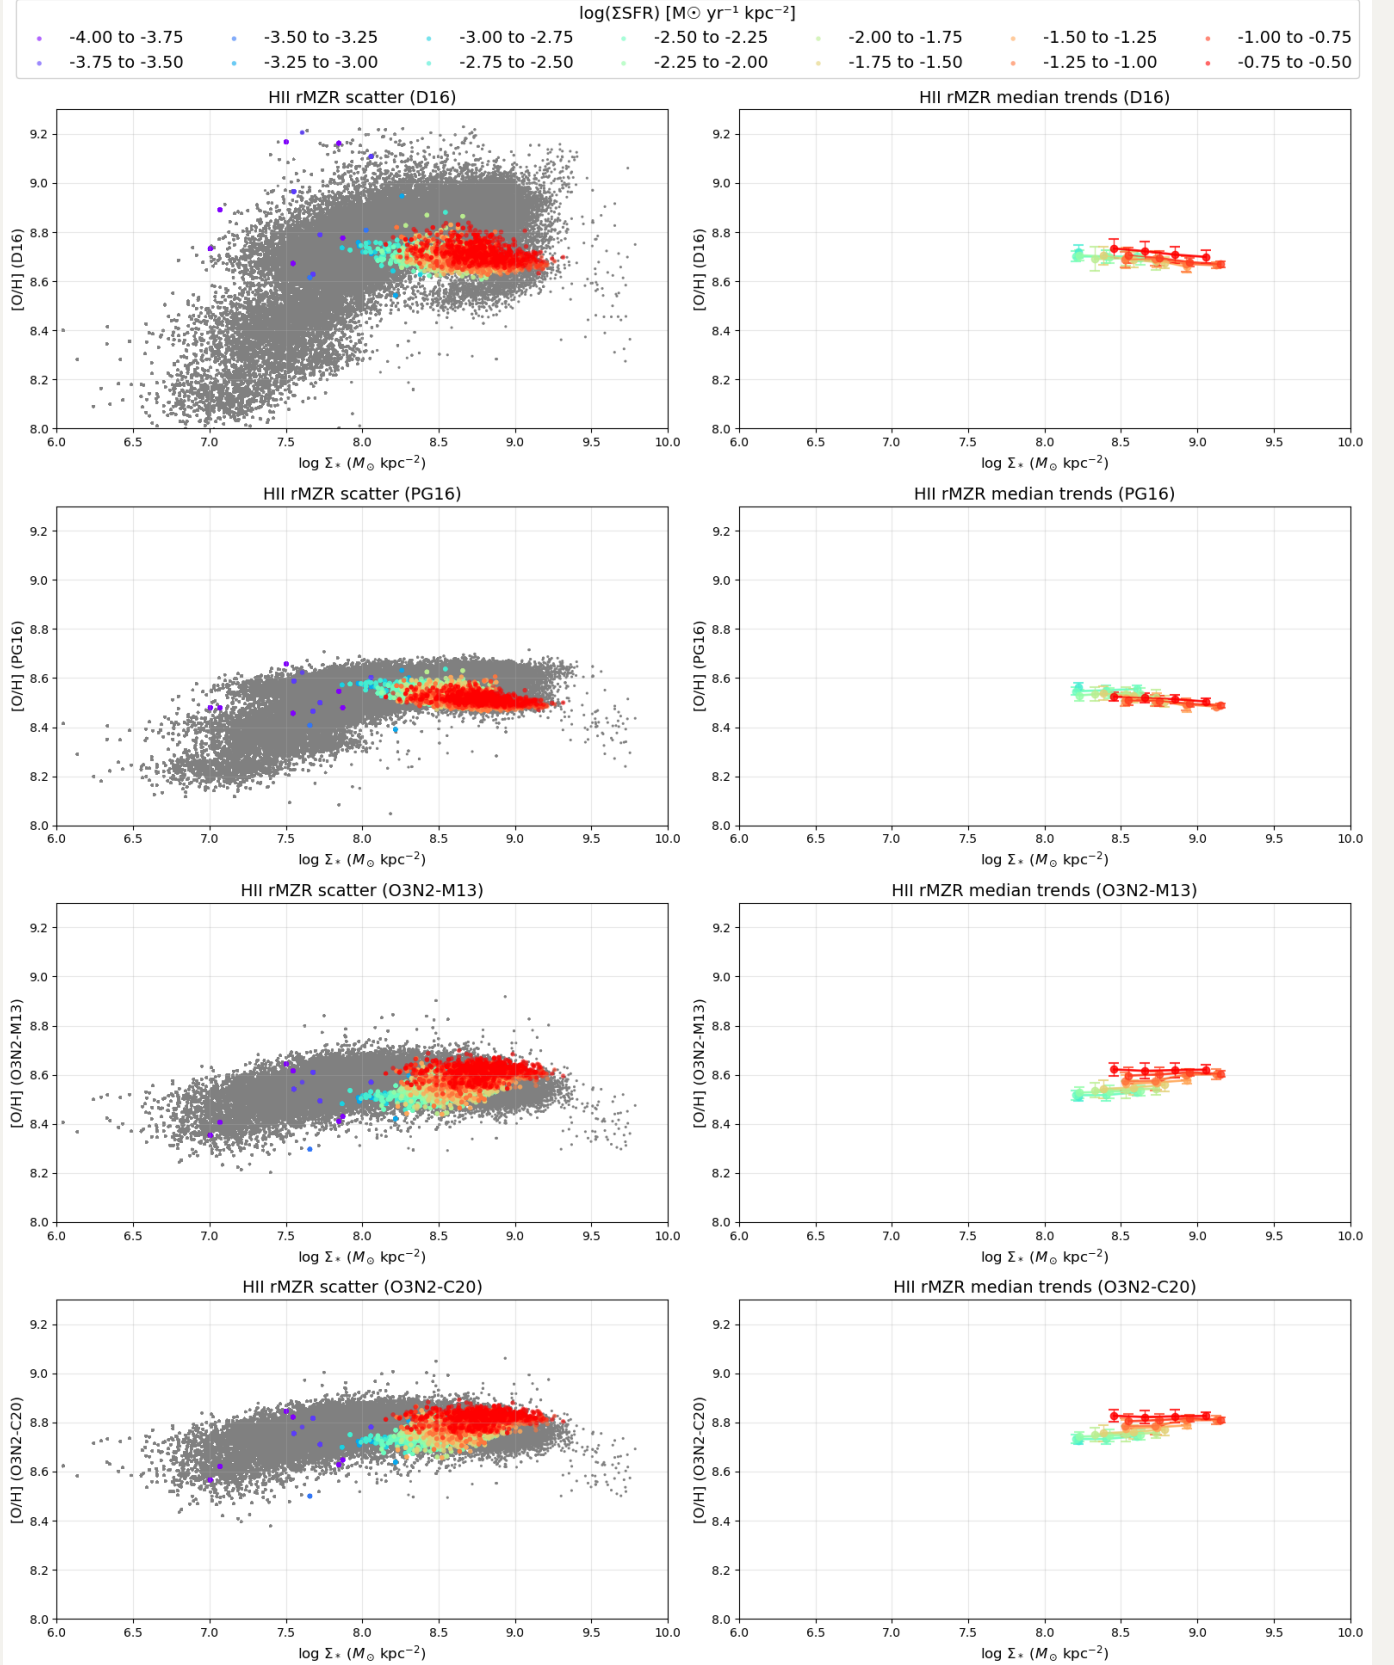

Individual

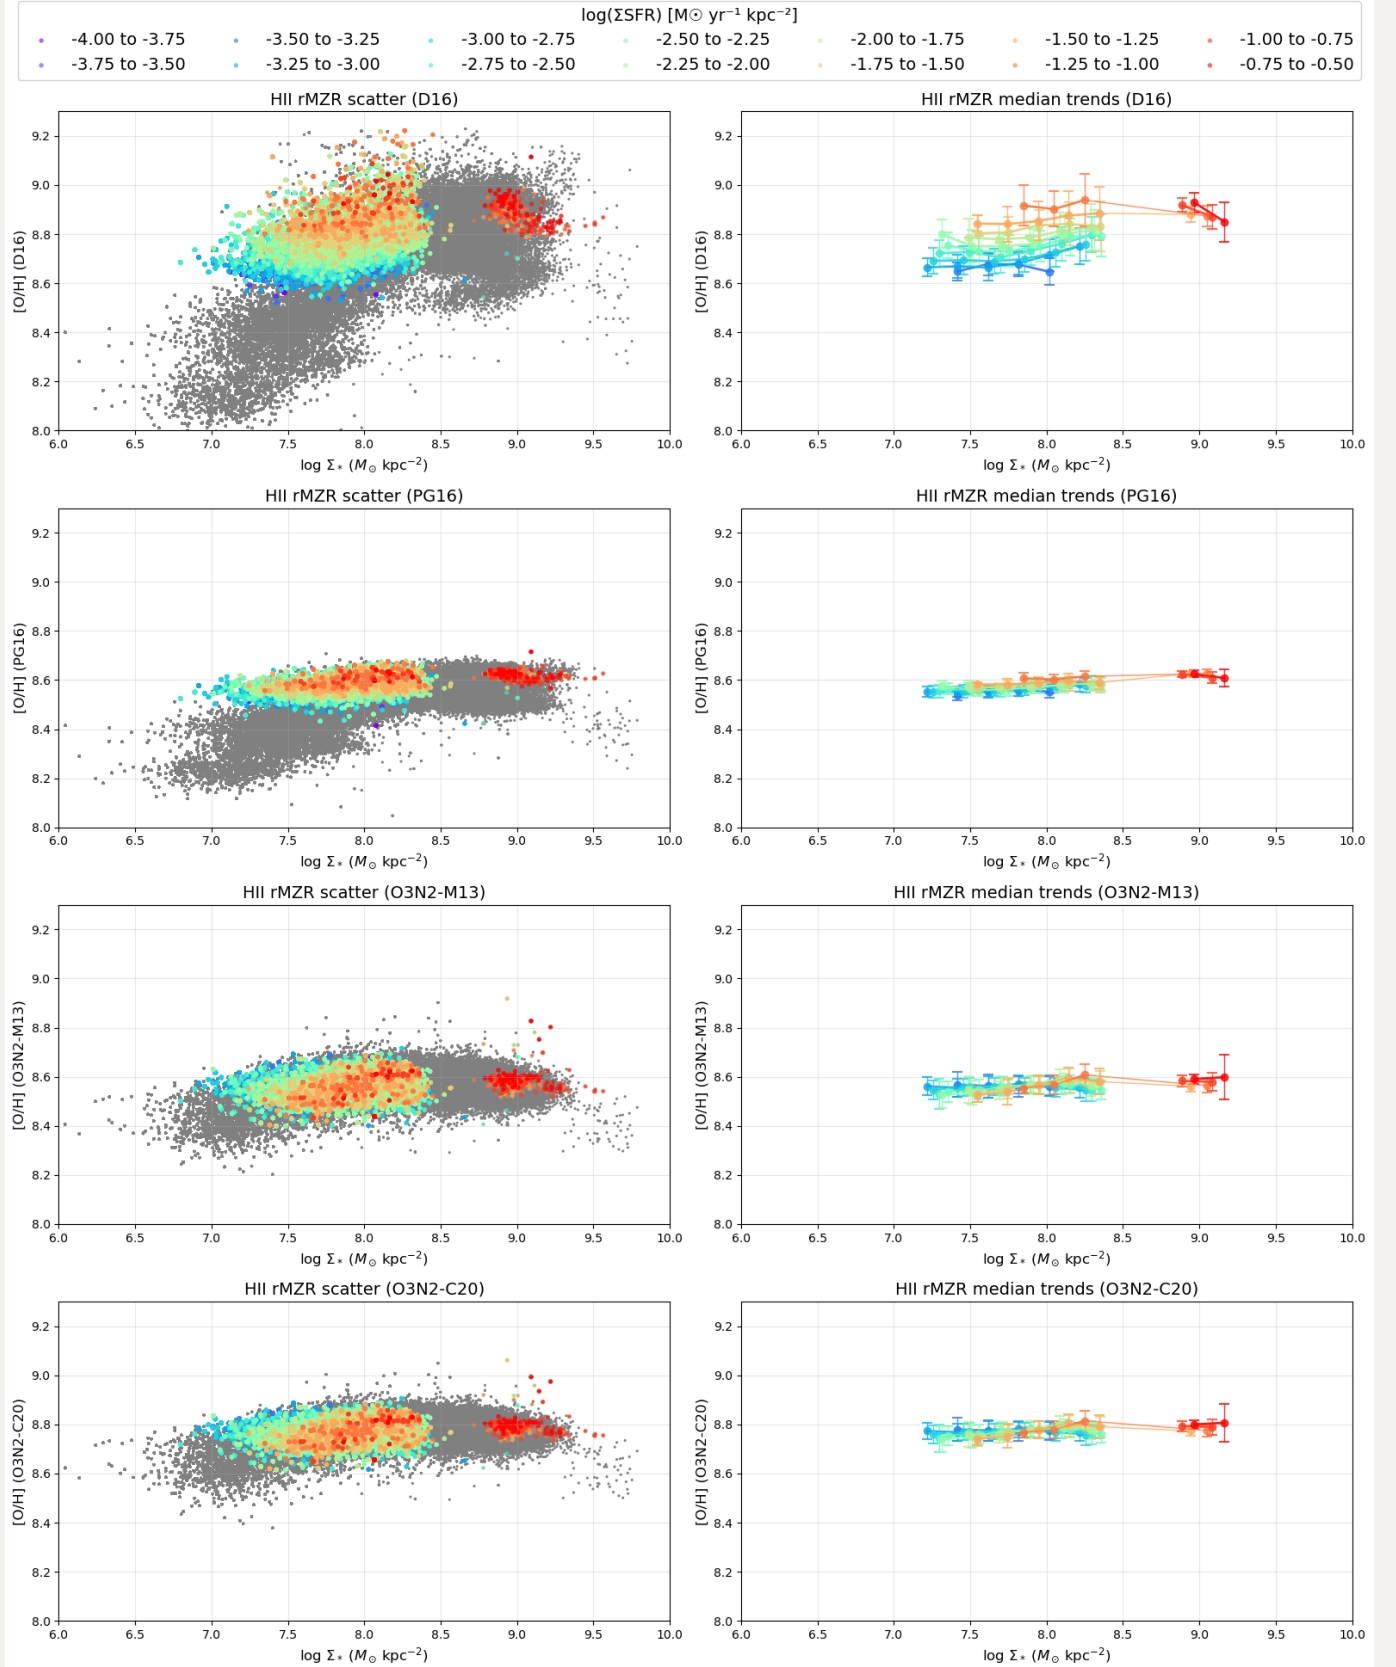

IC3392: rMZR behavior in Σ_{SFR} bins - HII regions only (Min 20 datapoints, Adjacent bins only)

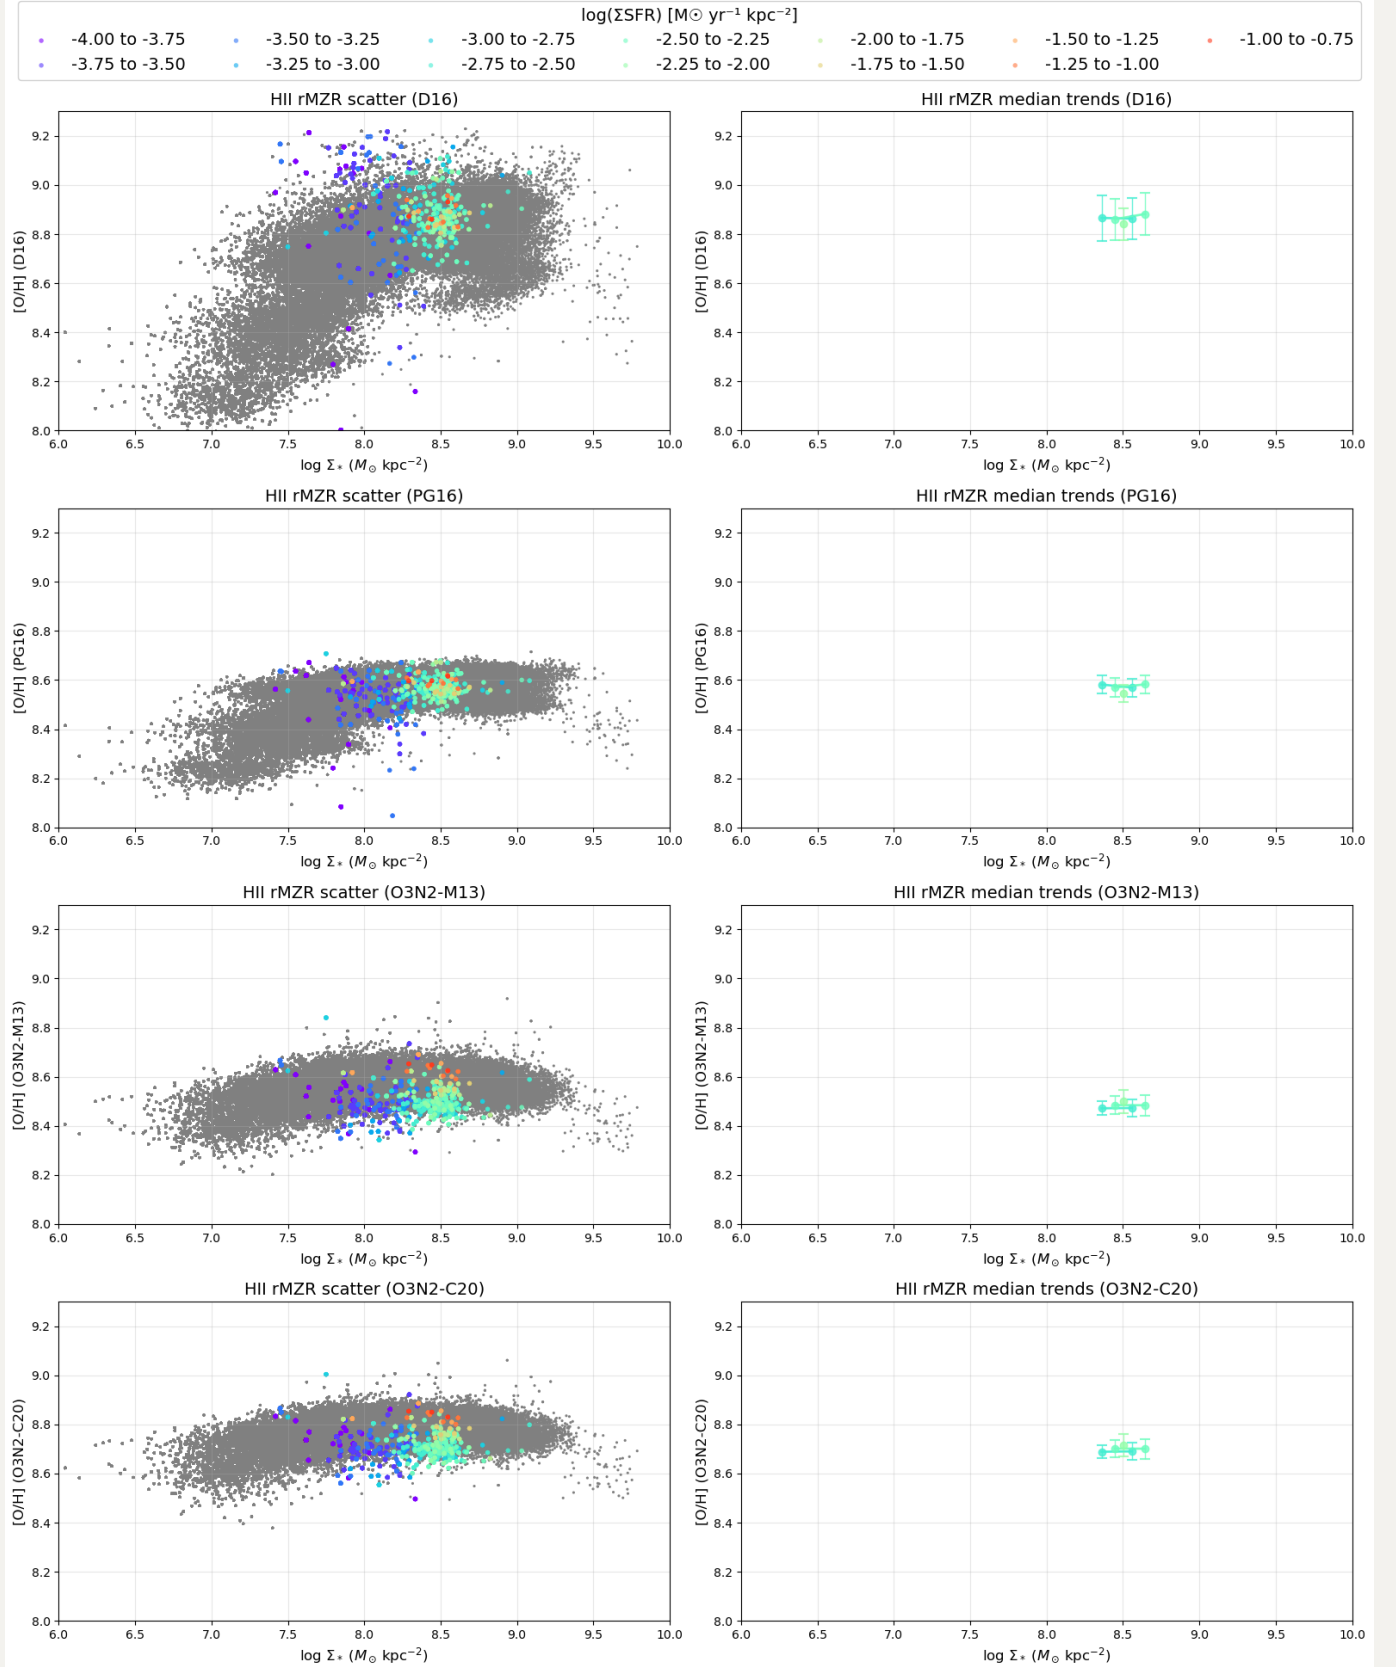

NGC4064: rMZR behavior in Σ_{SFR} bins - HII regions only (Min 20 datapoints, Adjacent bins only)

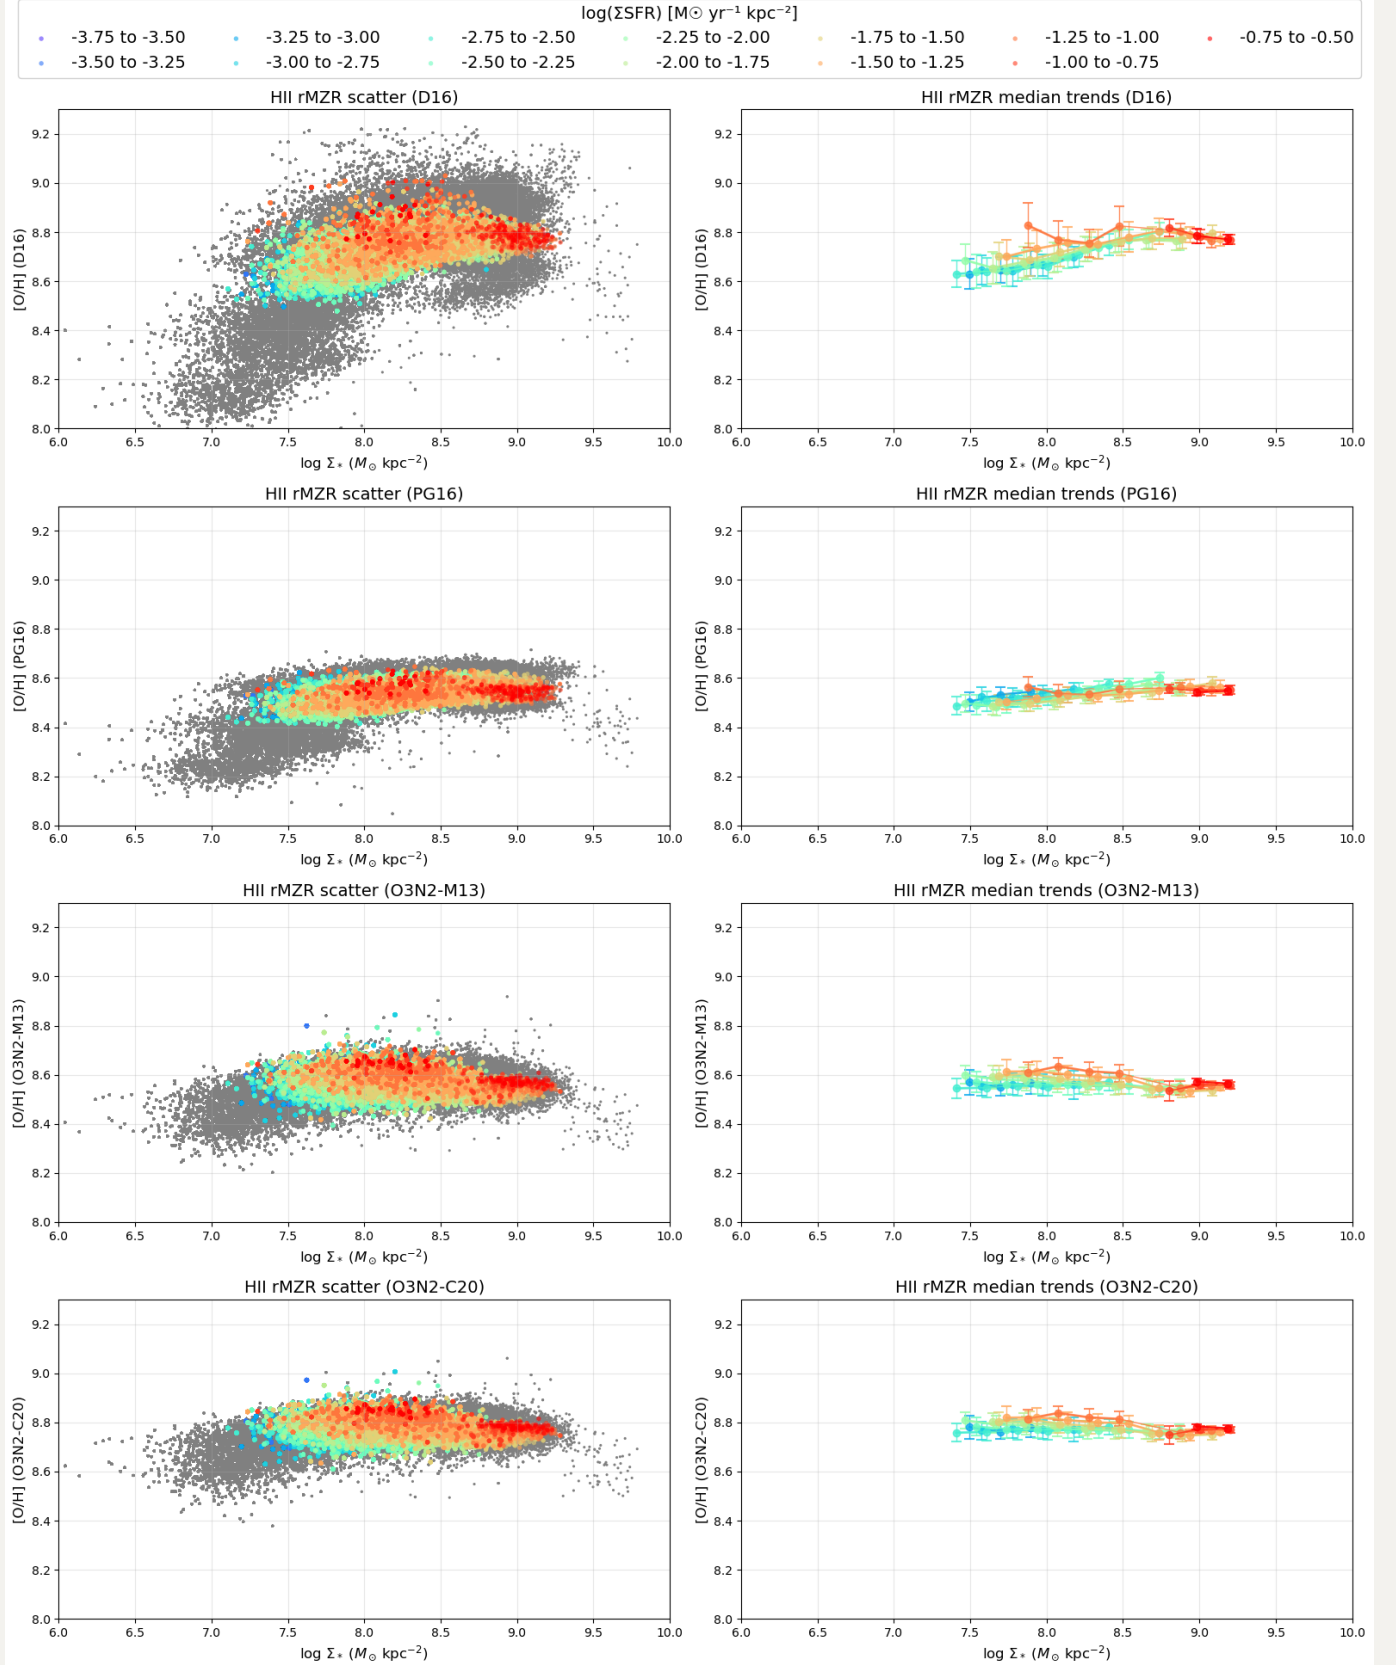

NGC4192: rMZR behavior in Σ_{SFR} bins - HII regions only (Min 20 datapoints, Adjacent bins only)

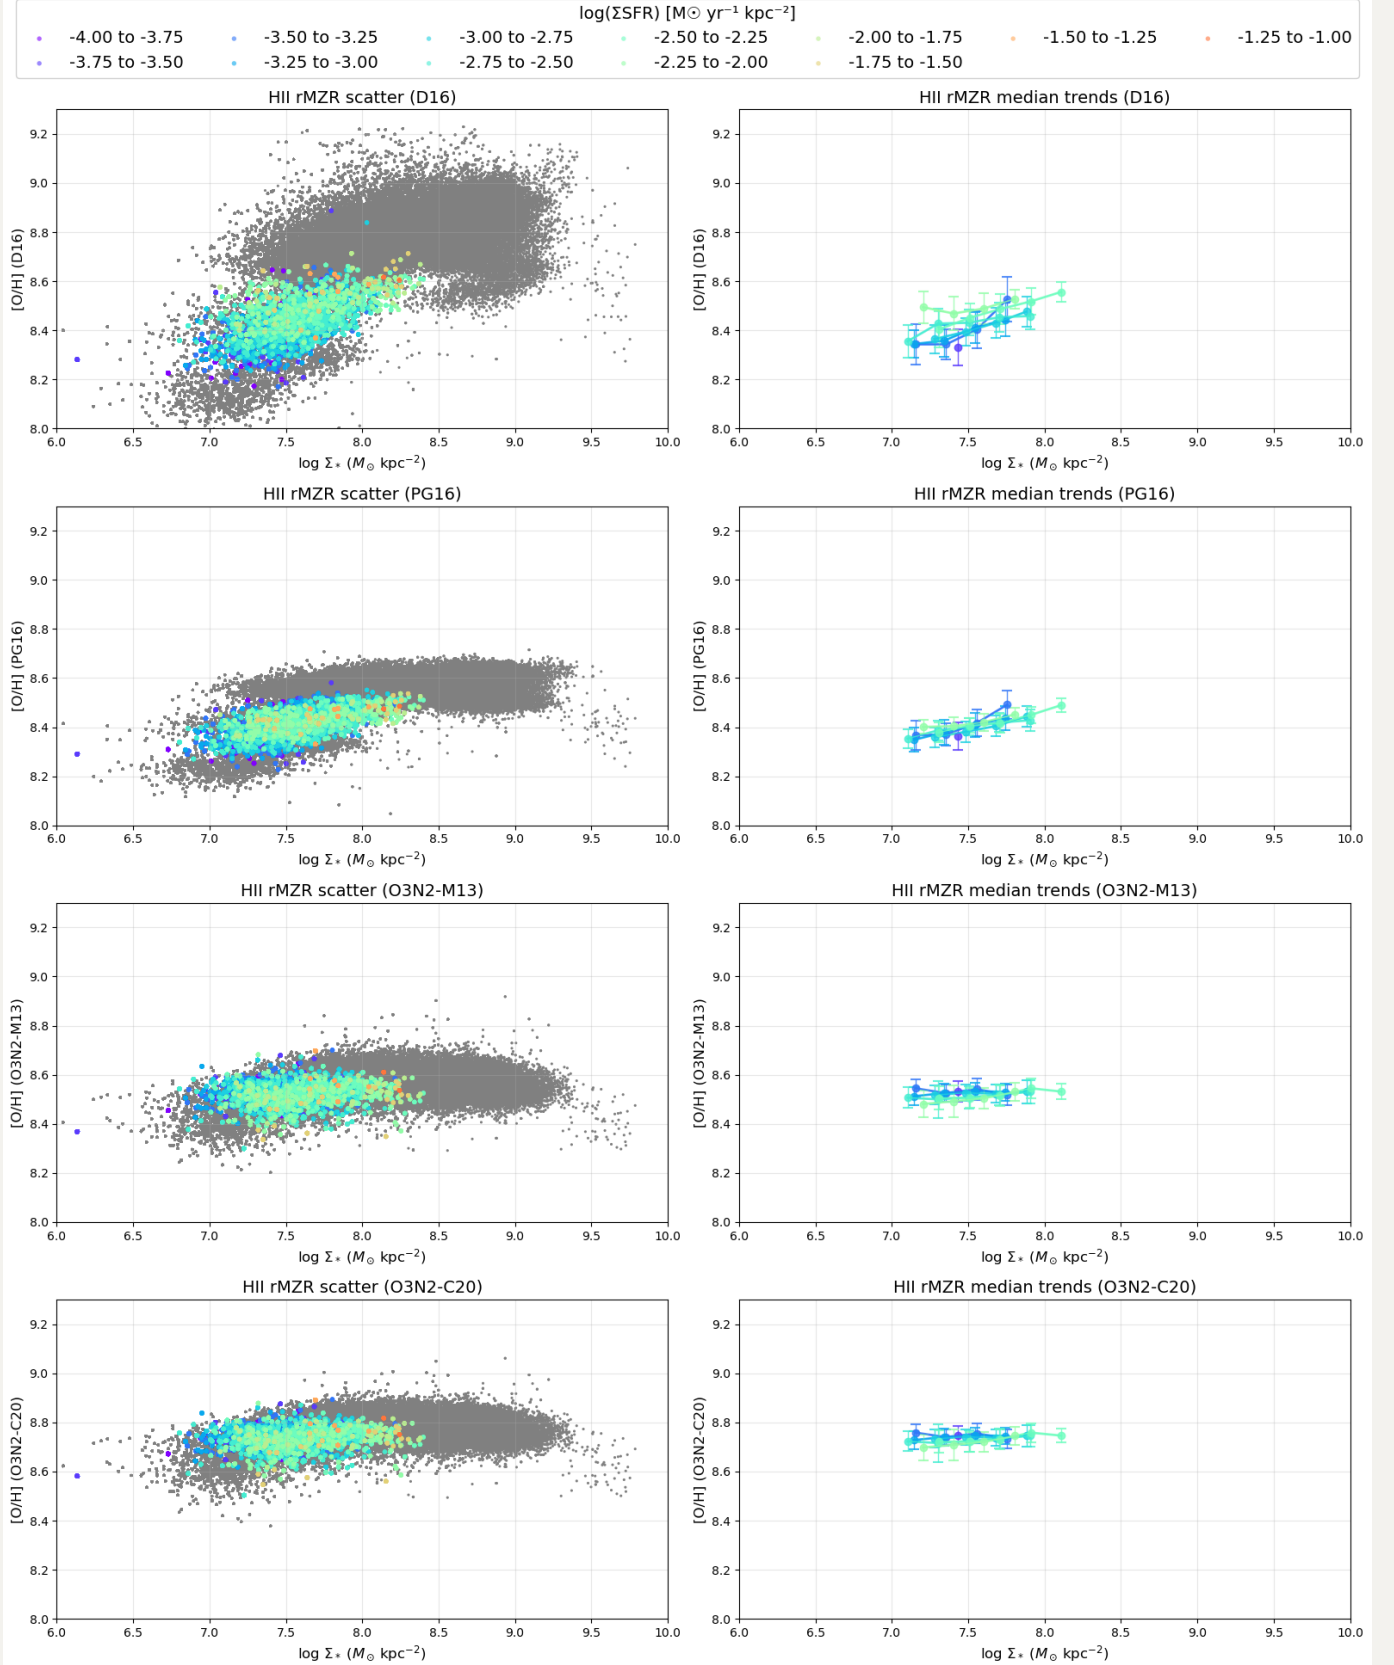

NGC4293: rMZR behavior in Σ_{SFR} bins - HII regions only (Min 20 datapoints, Adjacent bins only)

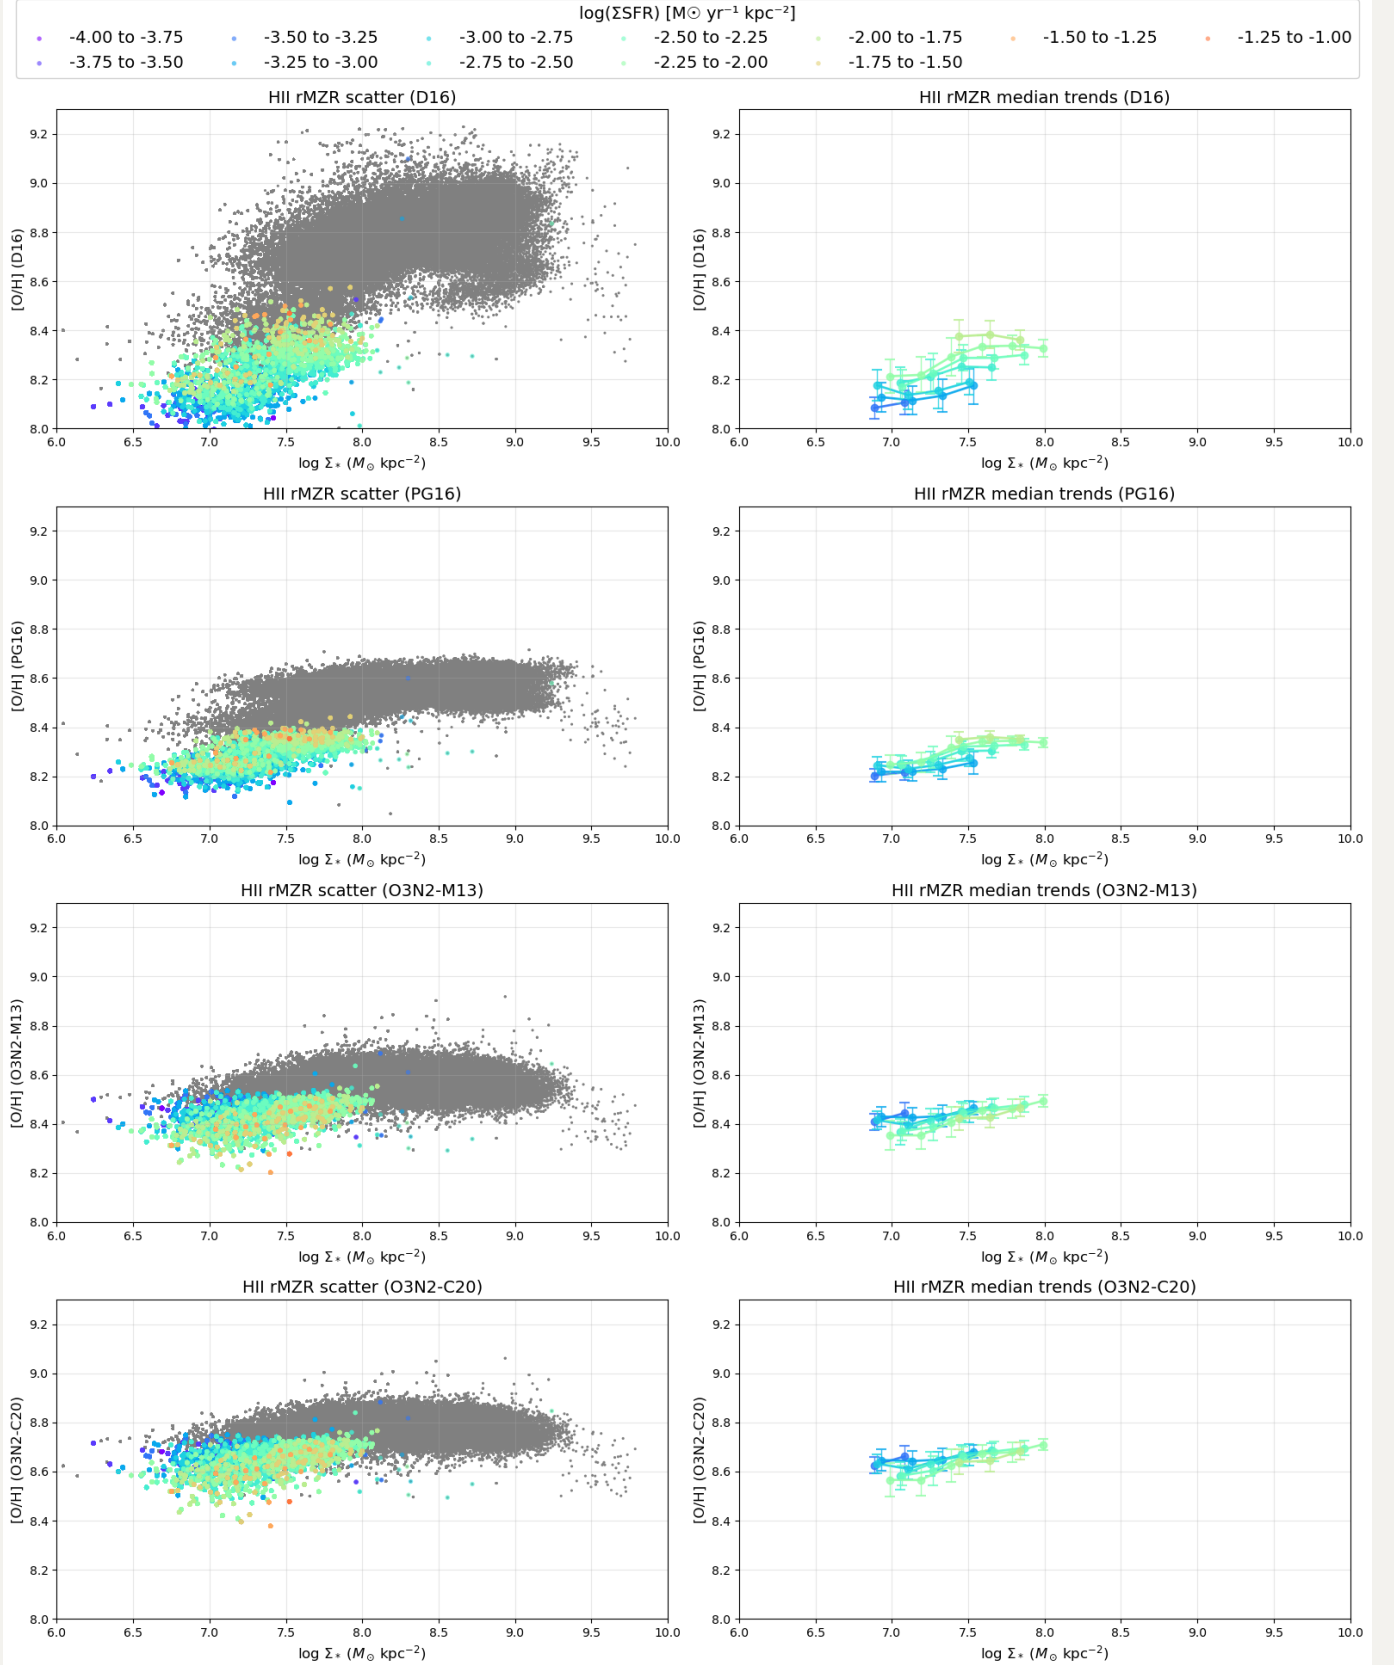

NGC4298: rMZR behavior in Σ_{SFR} bins - HII regions only (Min 20 datapoints, Adjacent bins only)

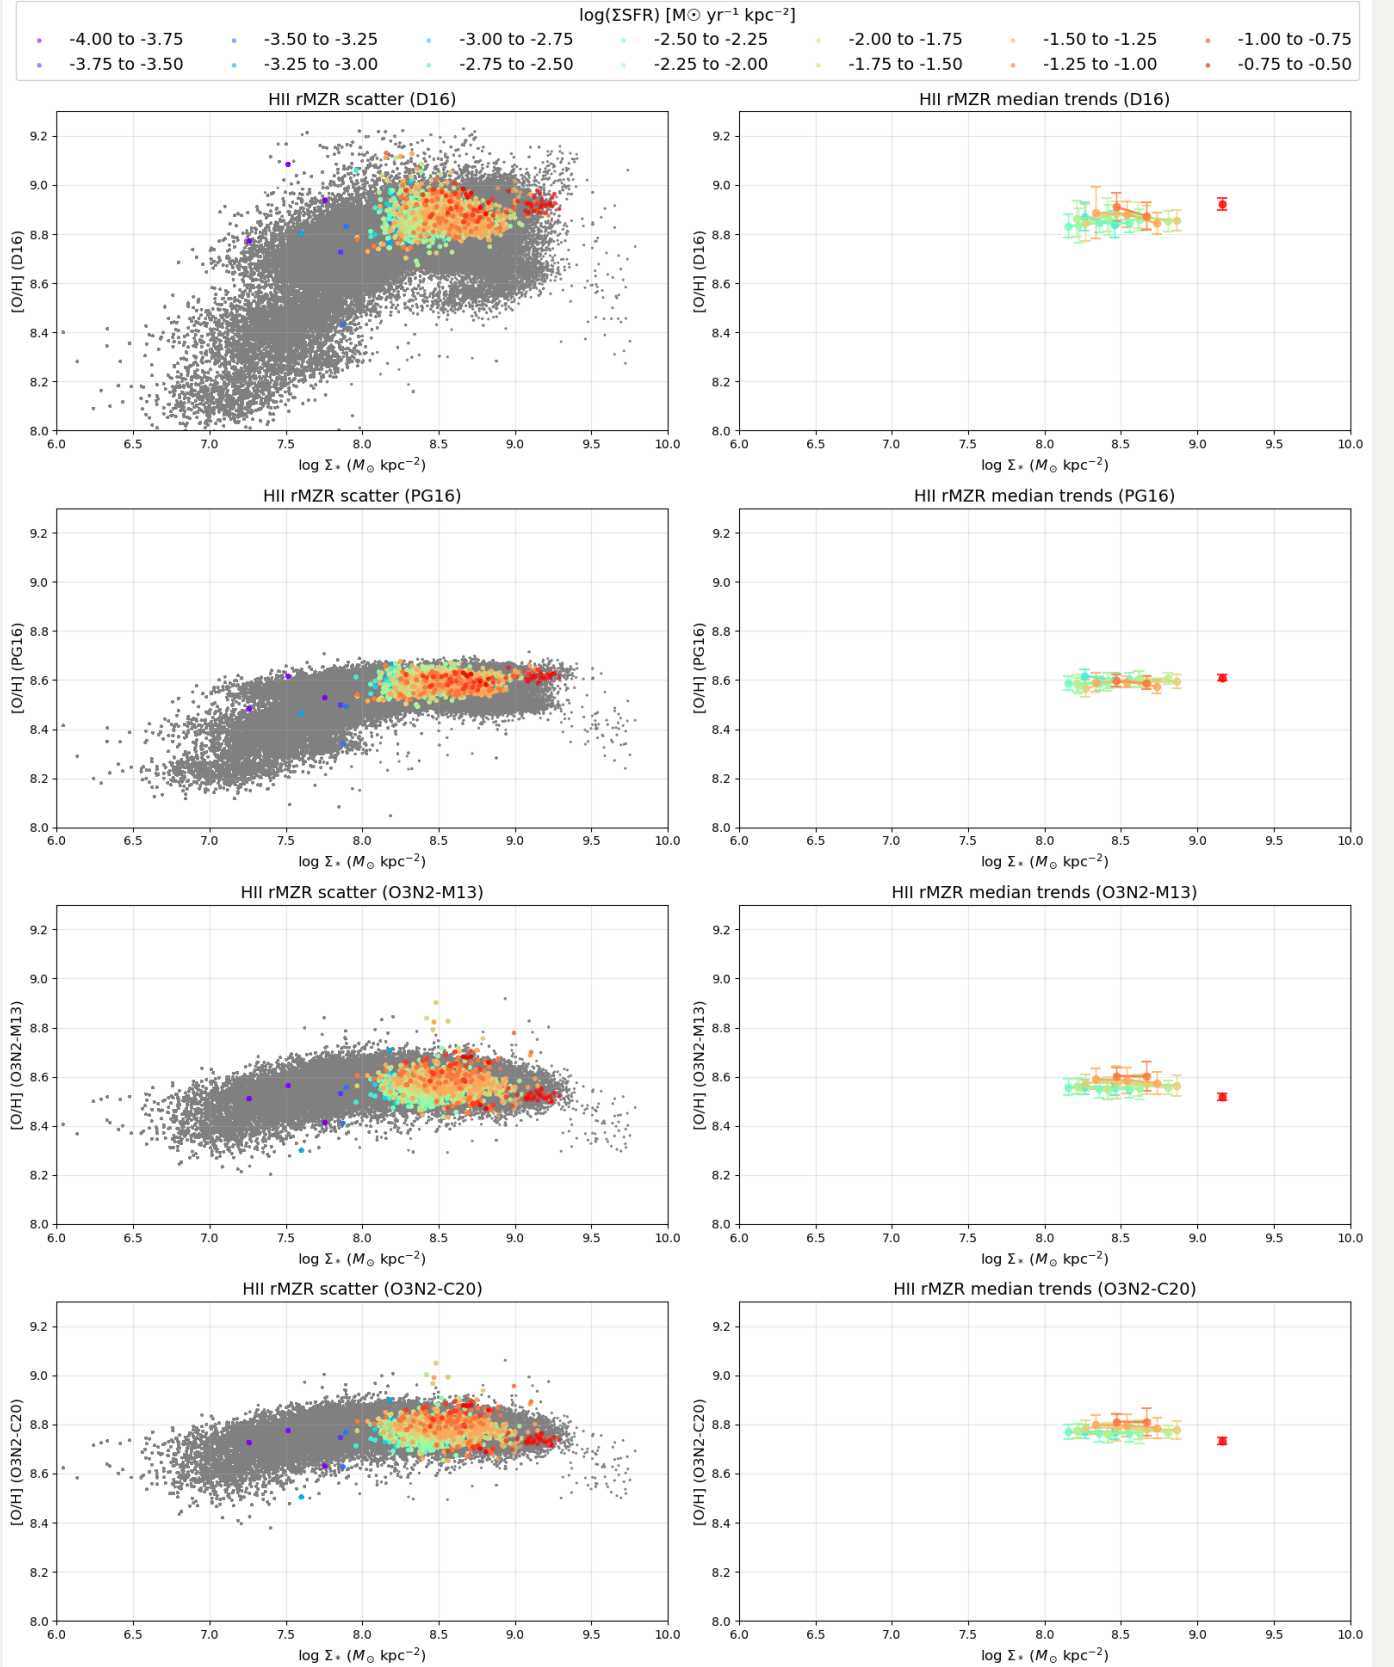

NGC4330: rMZR behavior in Σ_{SFR} bins - HII regions only (Min 20 datapoints, Adjacent bins only)

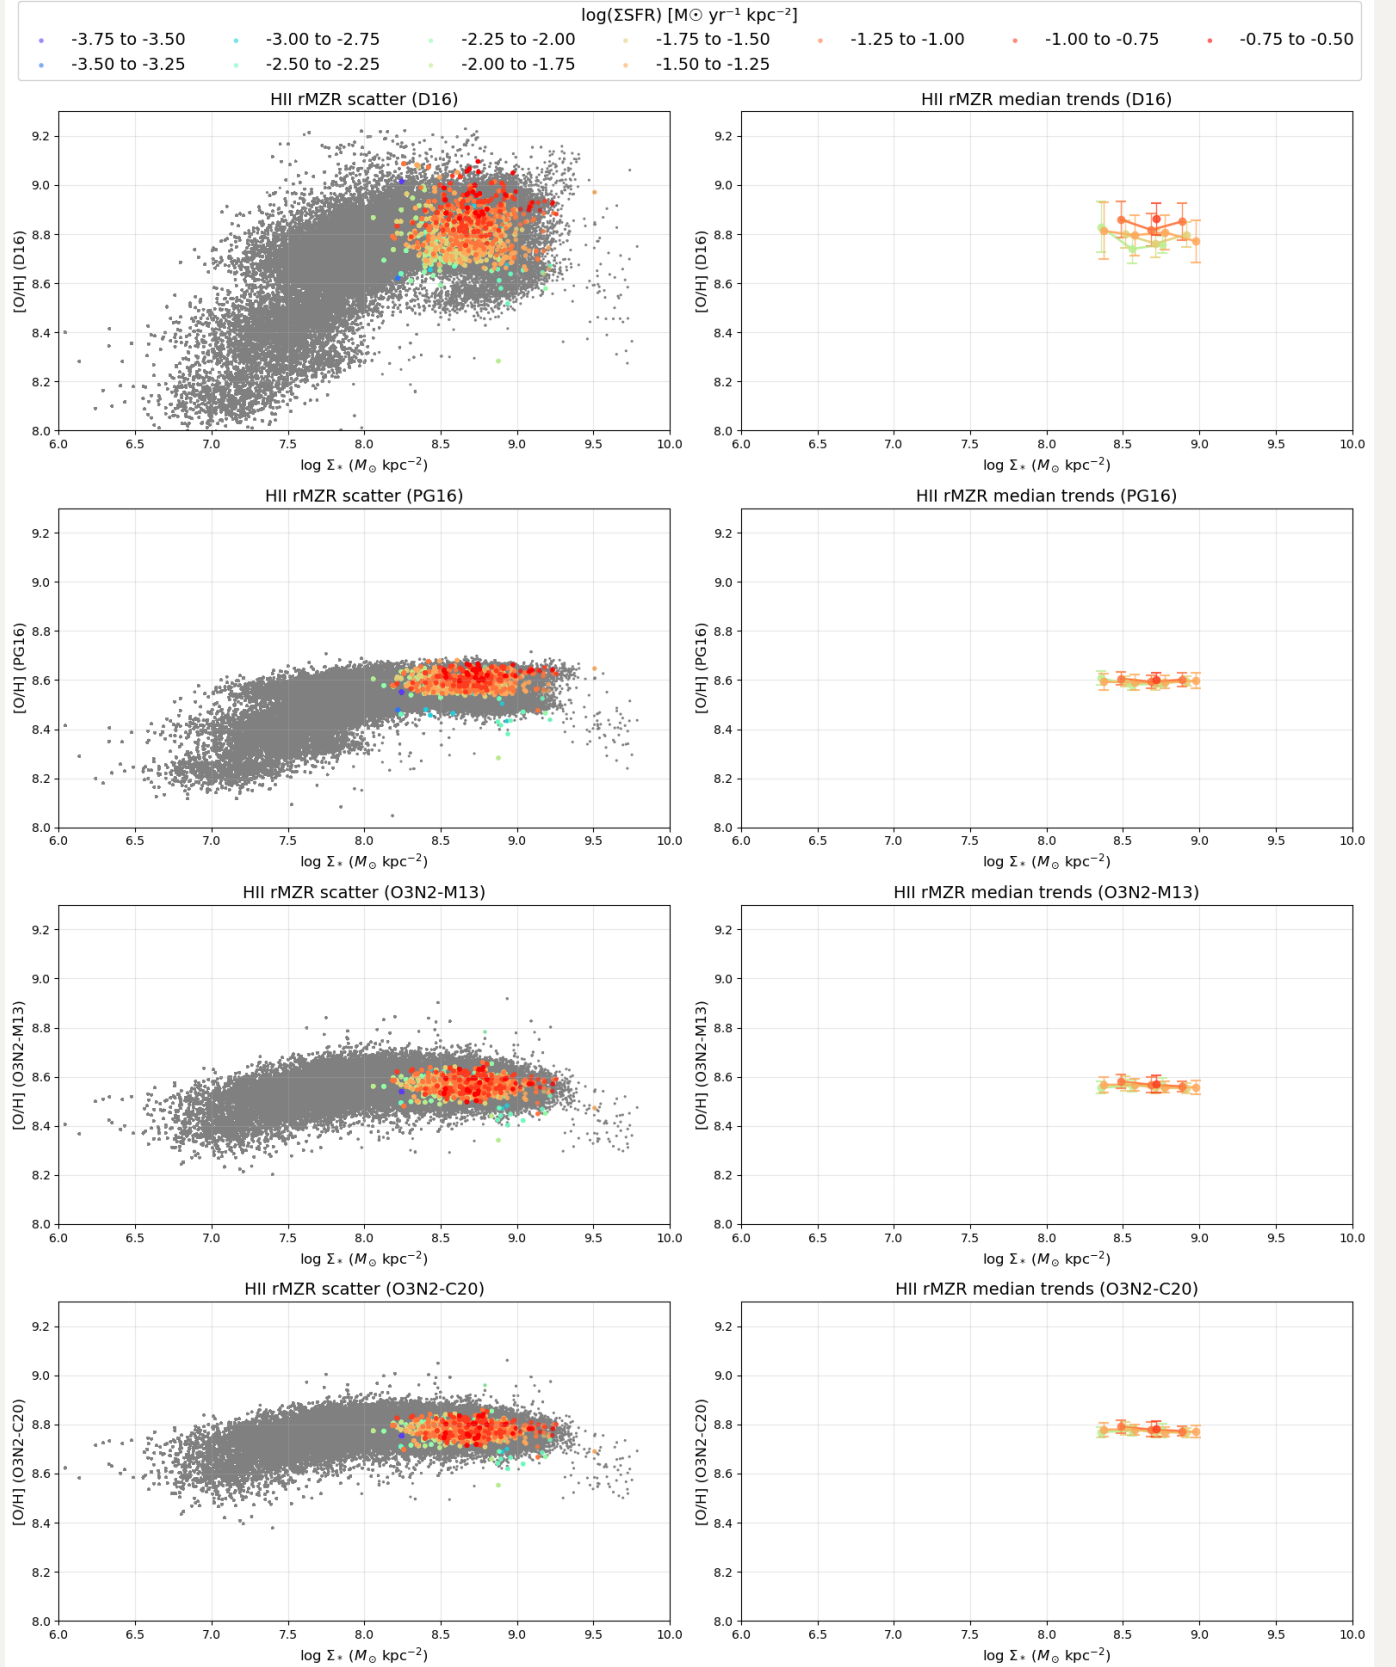

NGC4396: rMZR behavior in Σ_{SFR} bins - HII regions only (Min 20 datapoints, Adjacent bins only)

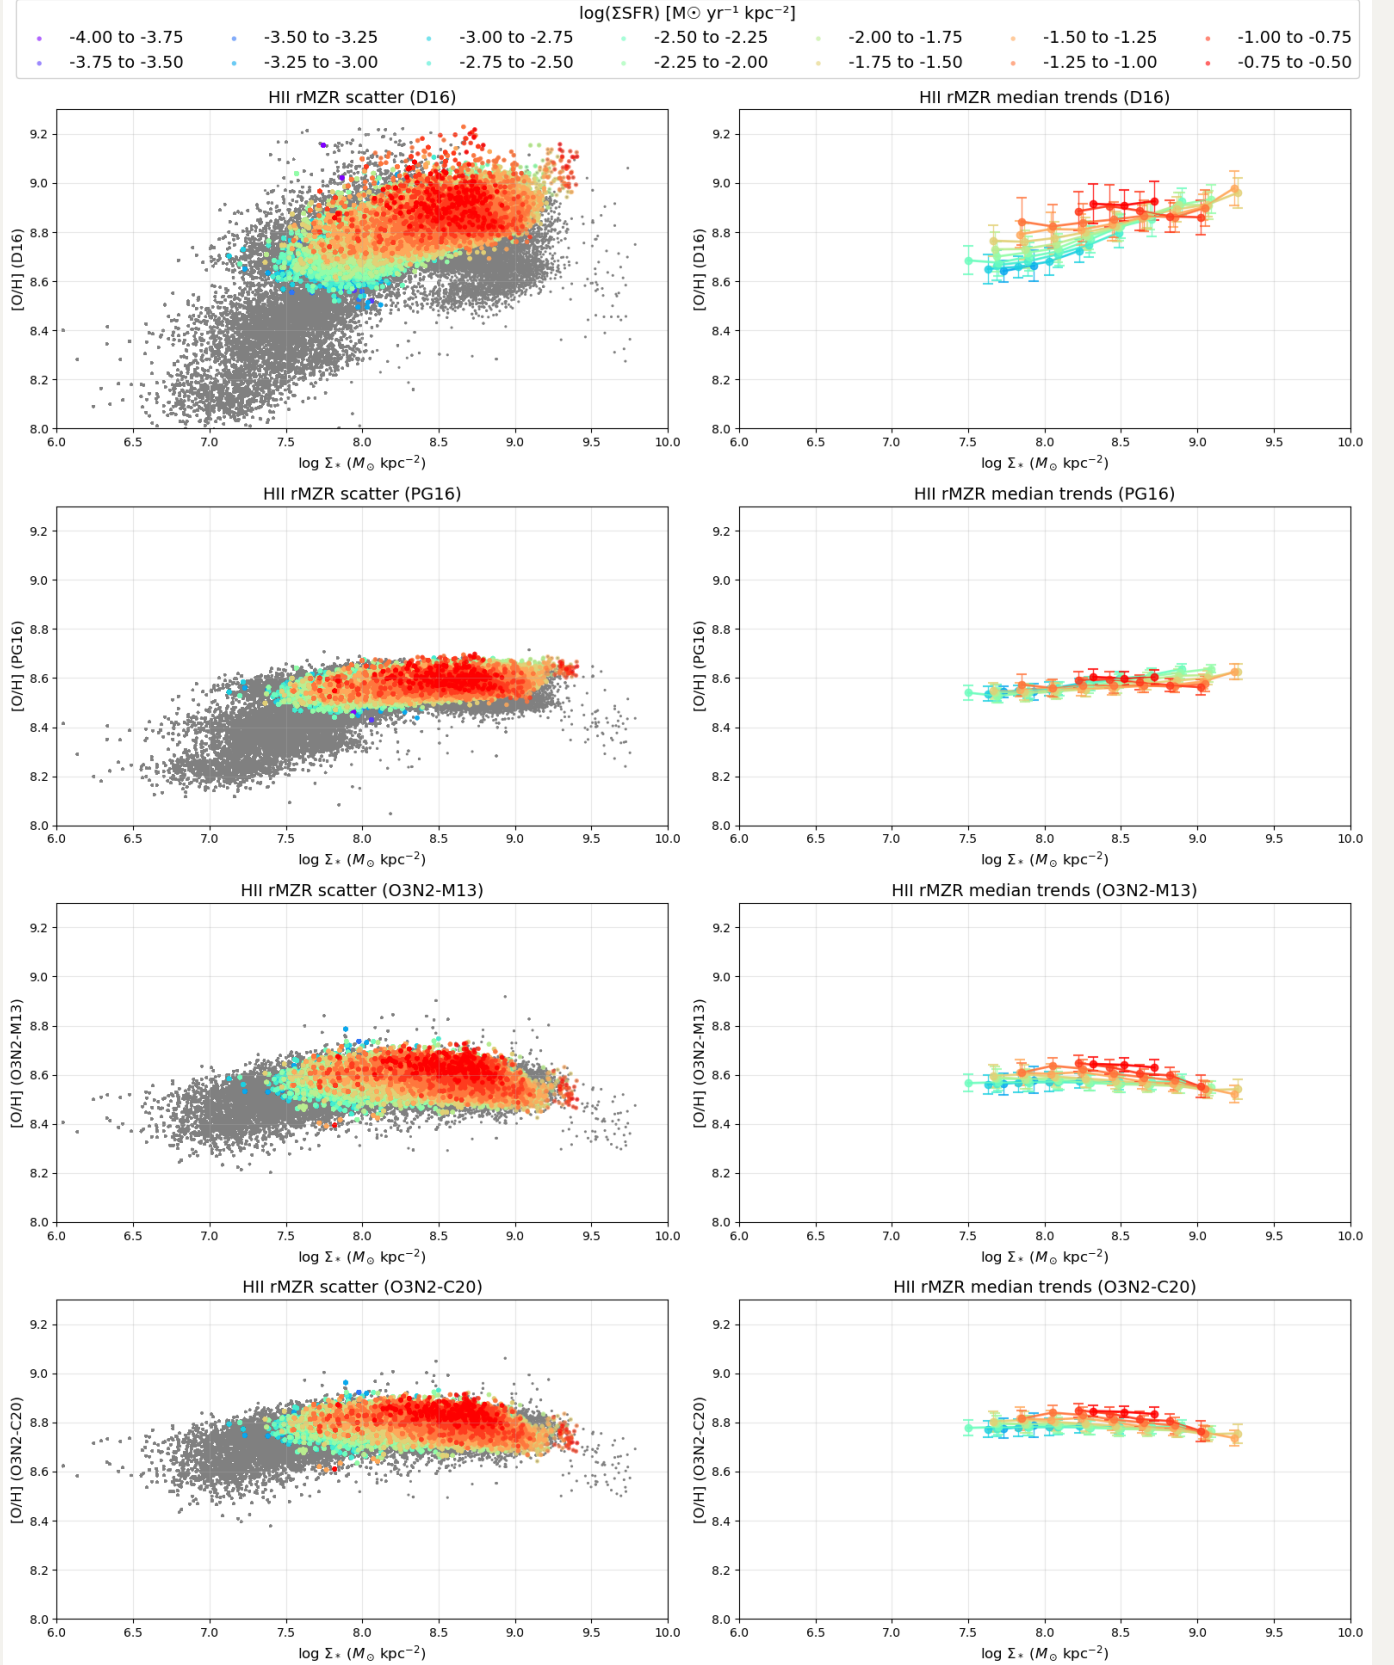

NGC4419: rMZR behavior in Σ_{SFR} bins - HII regions only (Min 20 datapoints, Adjacent bins only)

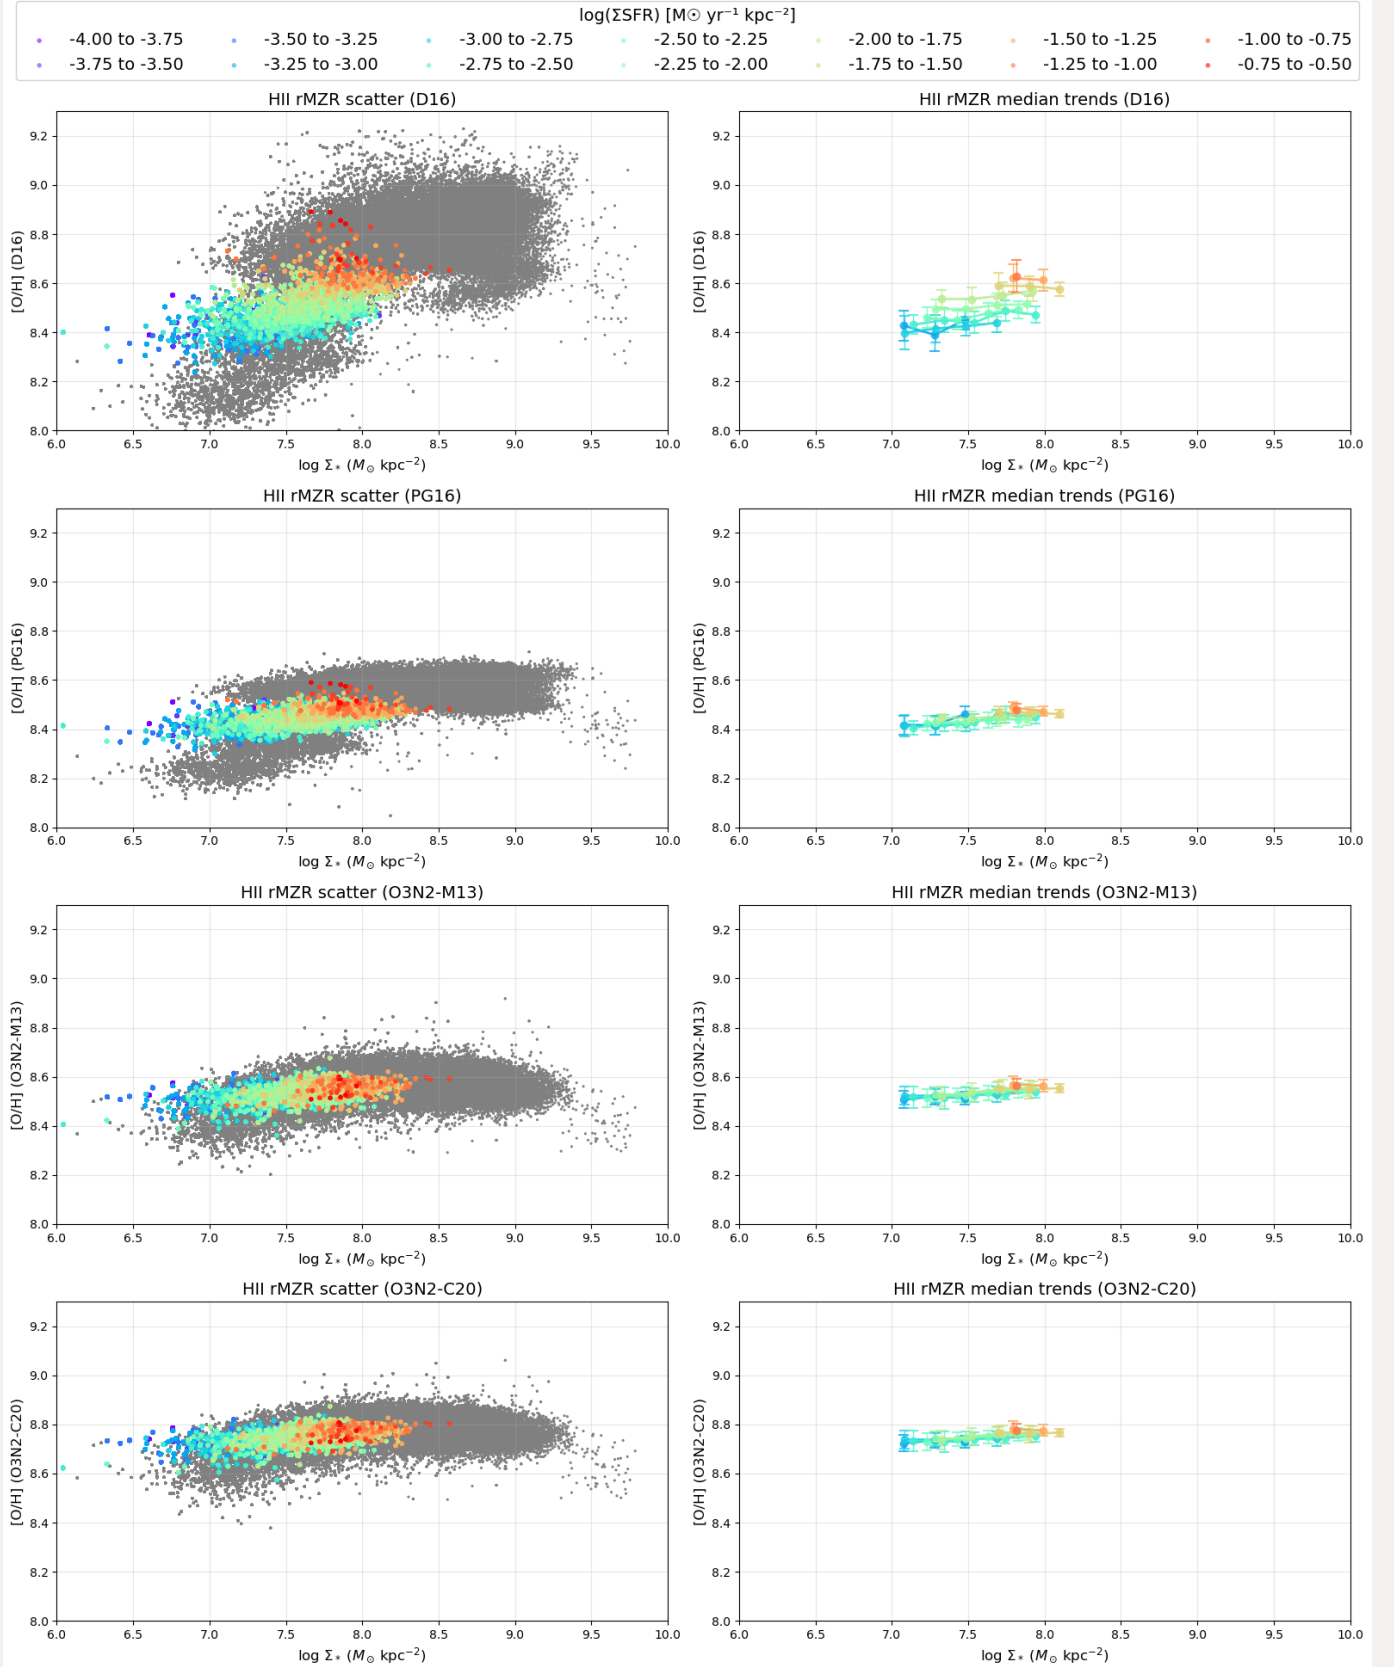

NGC4457: rMZR behavior in Σ_{SFR} bins - HII regions only (Min 20 datapoints, Adjacent bins only)

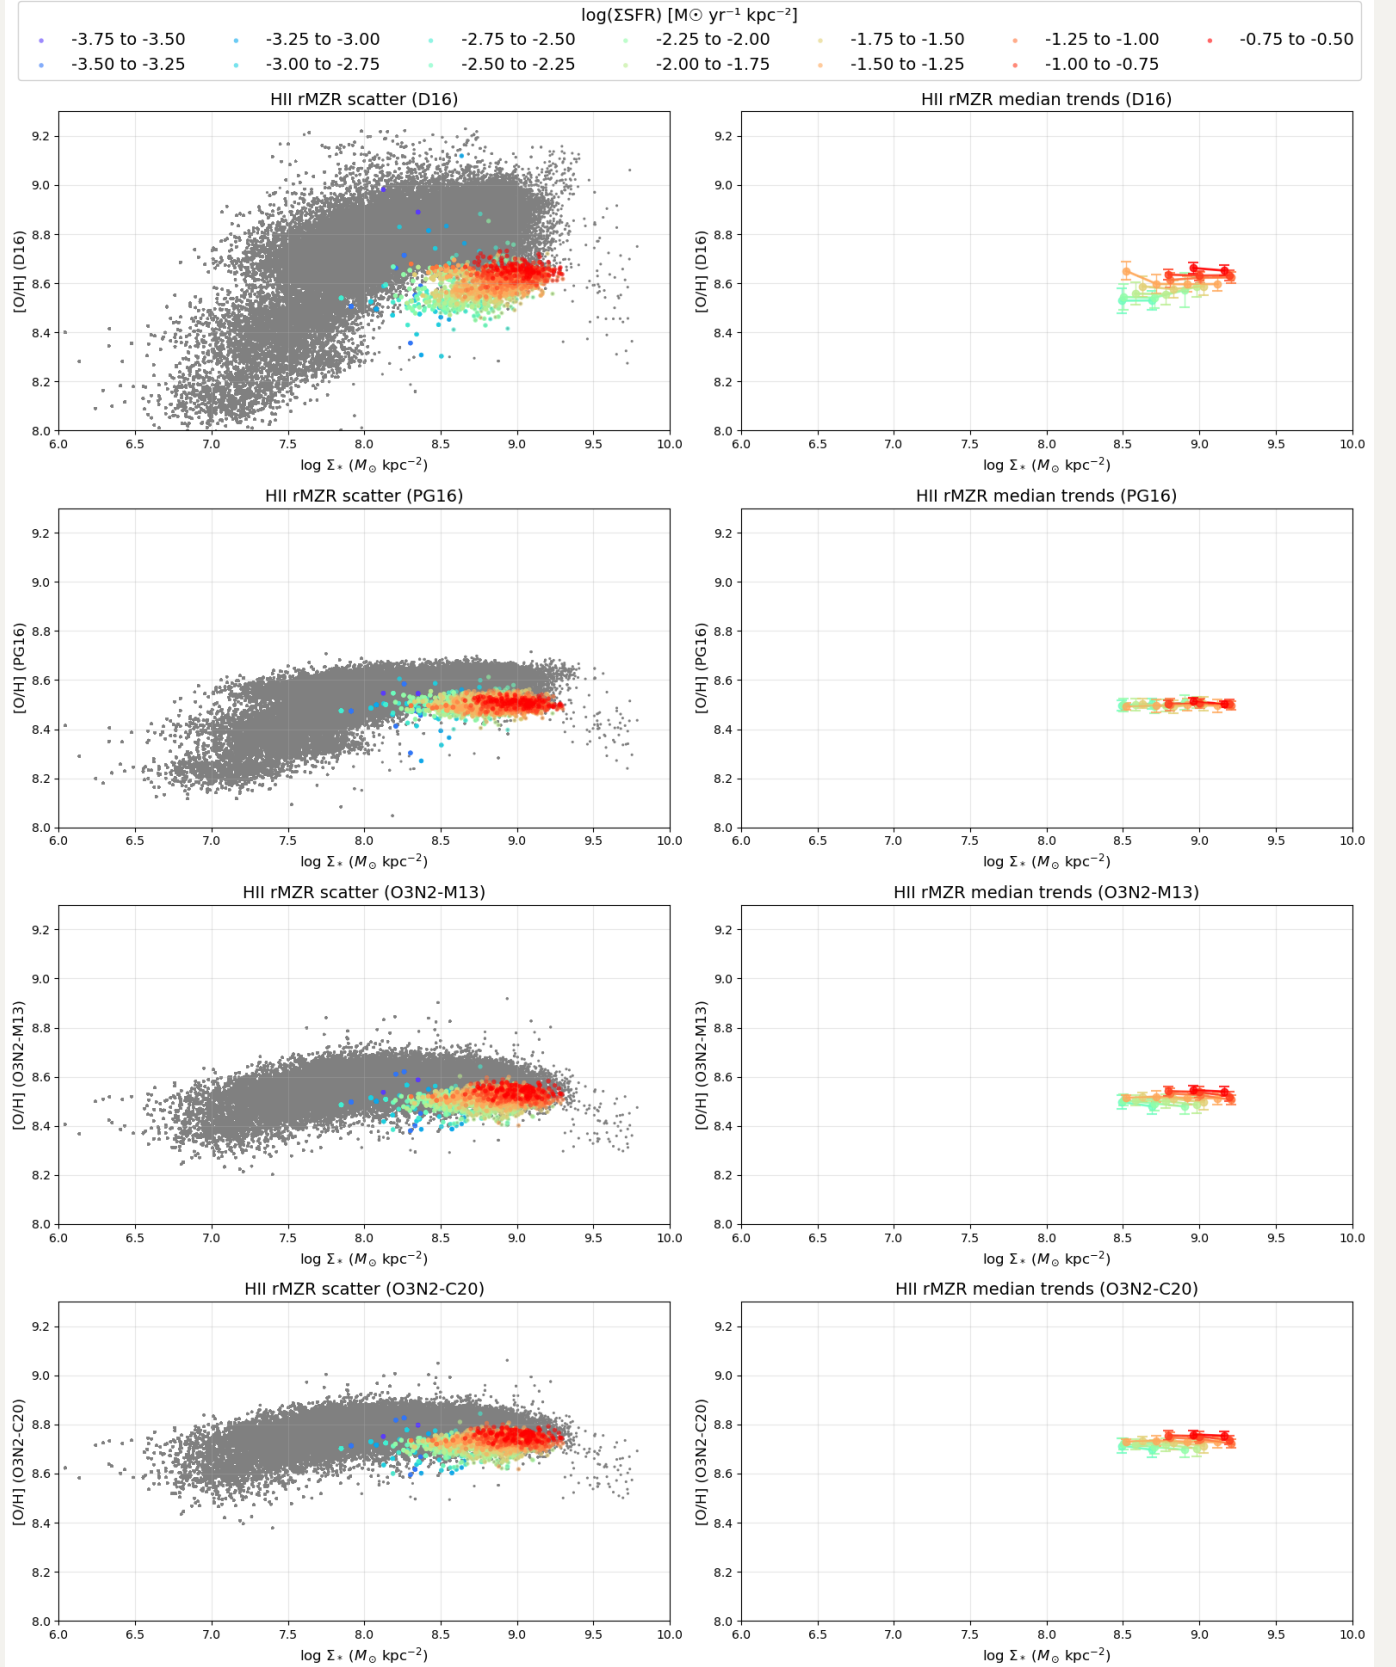

NGC4501: rMZR behavior in Σ_{SFR} bins - HII regions only (Min 20 datapoints, Adjacent bins only)

NGC4522: rMZR behavior in Σ_{SFR} bins - HII regions only (Min 20 datapoints, Adjacent bins only)

NGC4694: rMZR behavior in Σ_{SFR} bins - HII regions only (Min 20 datapoints, Adjacent bins only)

NGC4698: rMZR behavior in Σ_{SFR} bins - HII regions only (Min 20 datapoints, Adjacent bins only)
