

20251204 Updated Range of Spearman Calculation in Each Mass Bin

So previously, we have only selected data within 95% contour to do Spearman test and hope that can remove some bias.

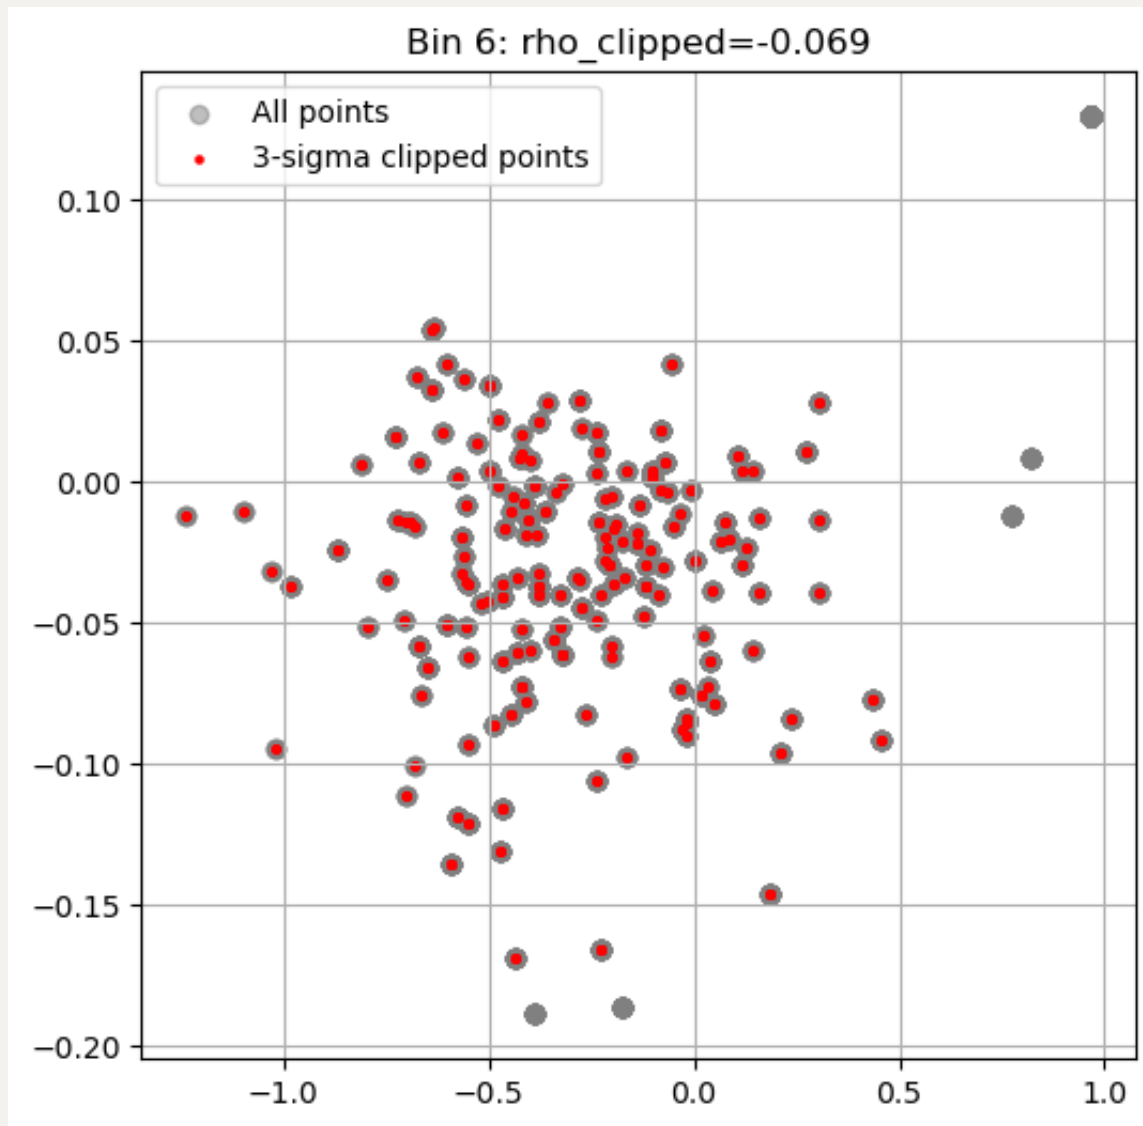

So yes the last mass bin still looks problematic.

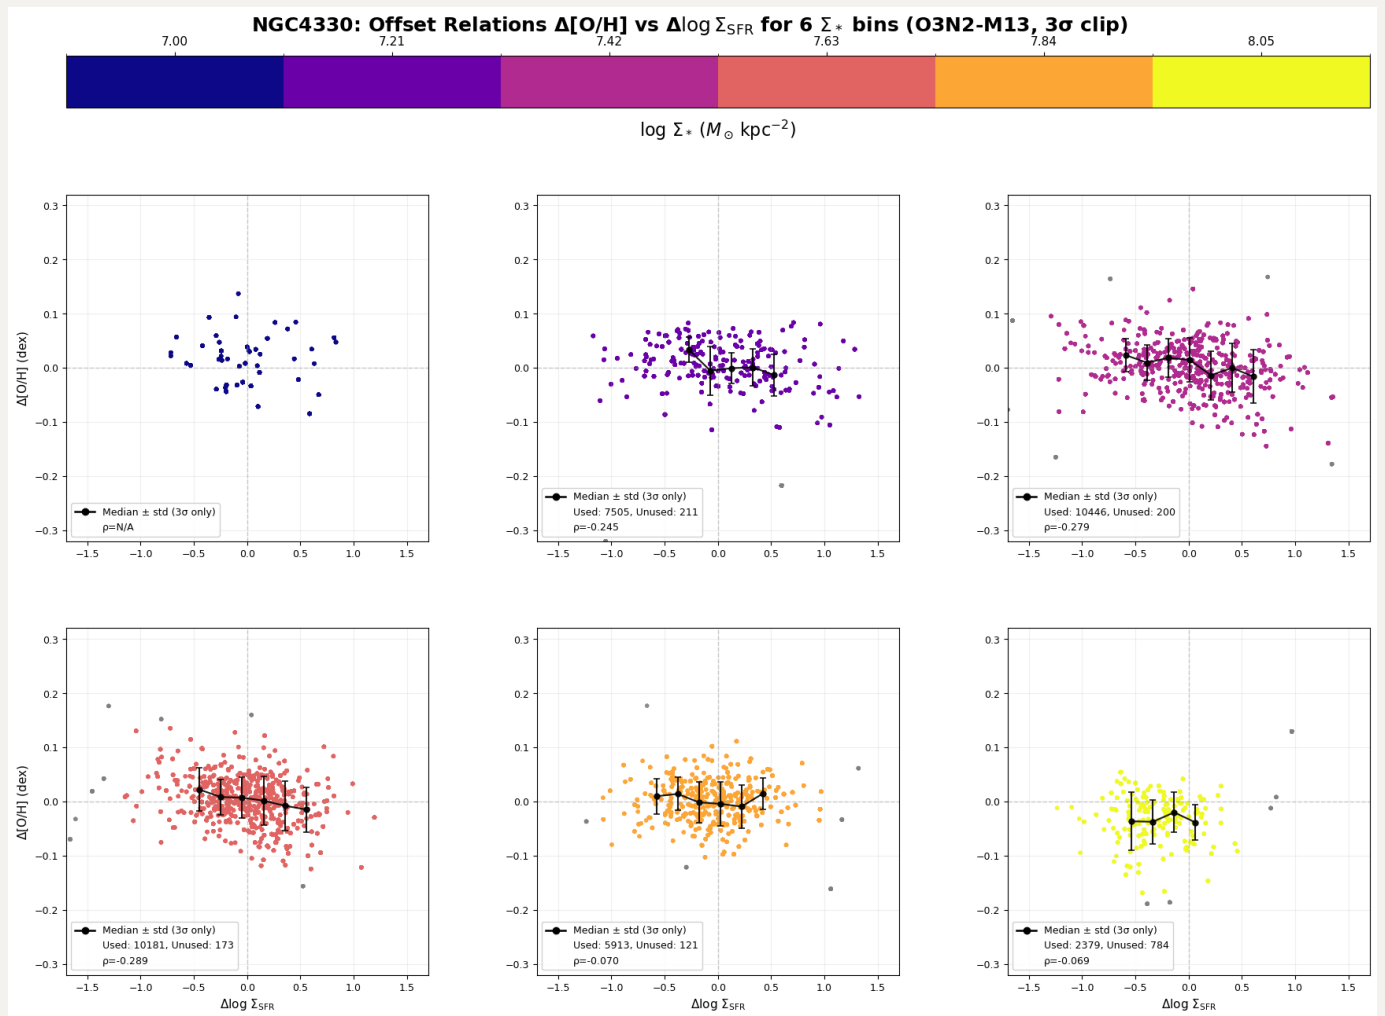

And I check that we still get 0.518 just because the extreme outliers. Particularly, the top right red dots: that bin represents 36 spaxels.

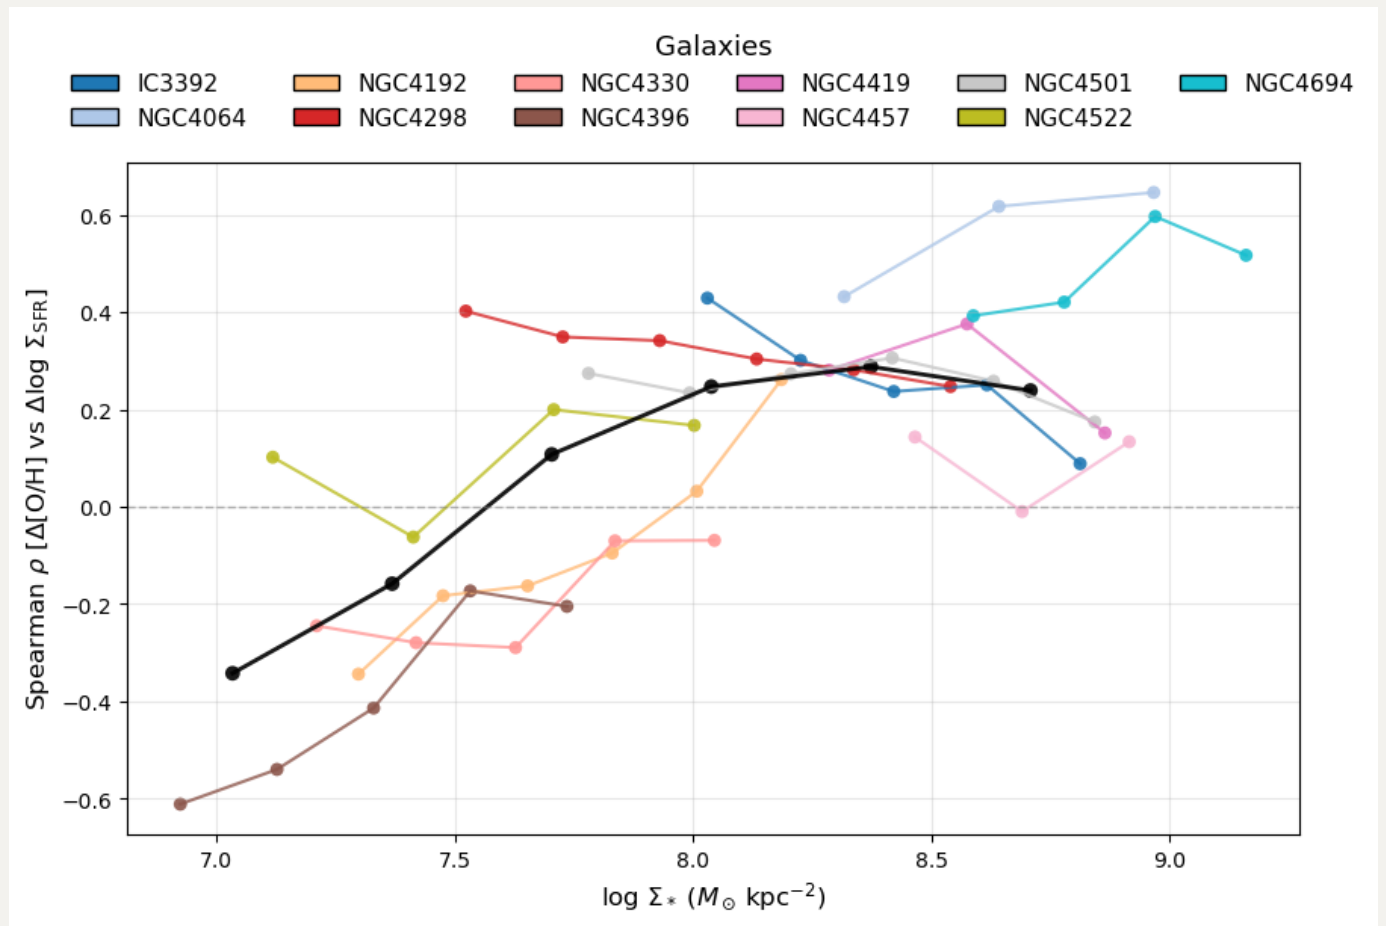

Hence, instead of select by 95% contour, I clip the data out of 3σ in both SFR and O/H, and the result looks as expected.

And when I update to other mass bins, results are still similar.

And so i think we can update to all the galaxies:

And all indicators:
