

20260803 Pre peak rSFMS

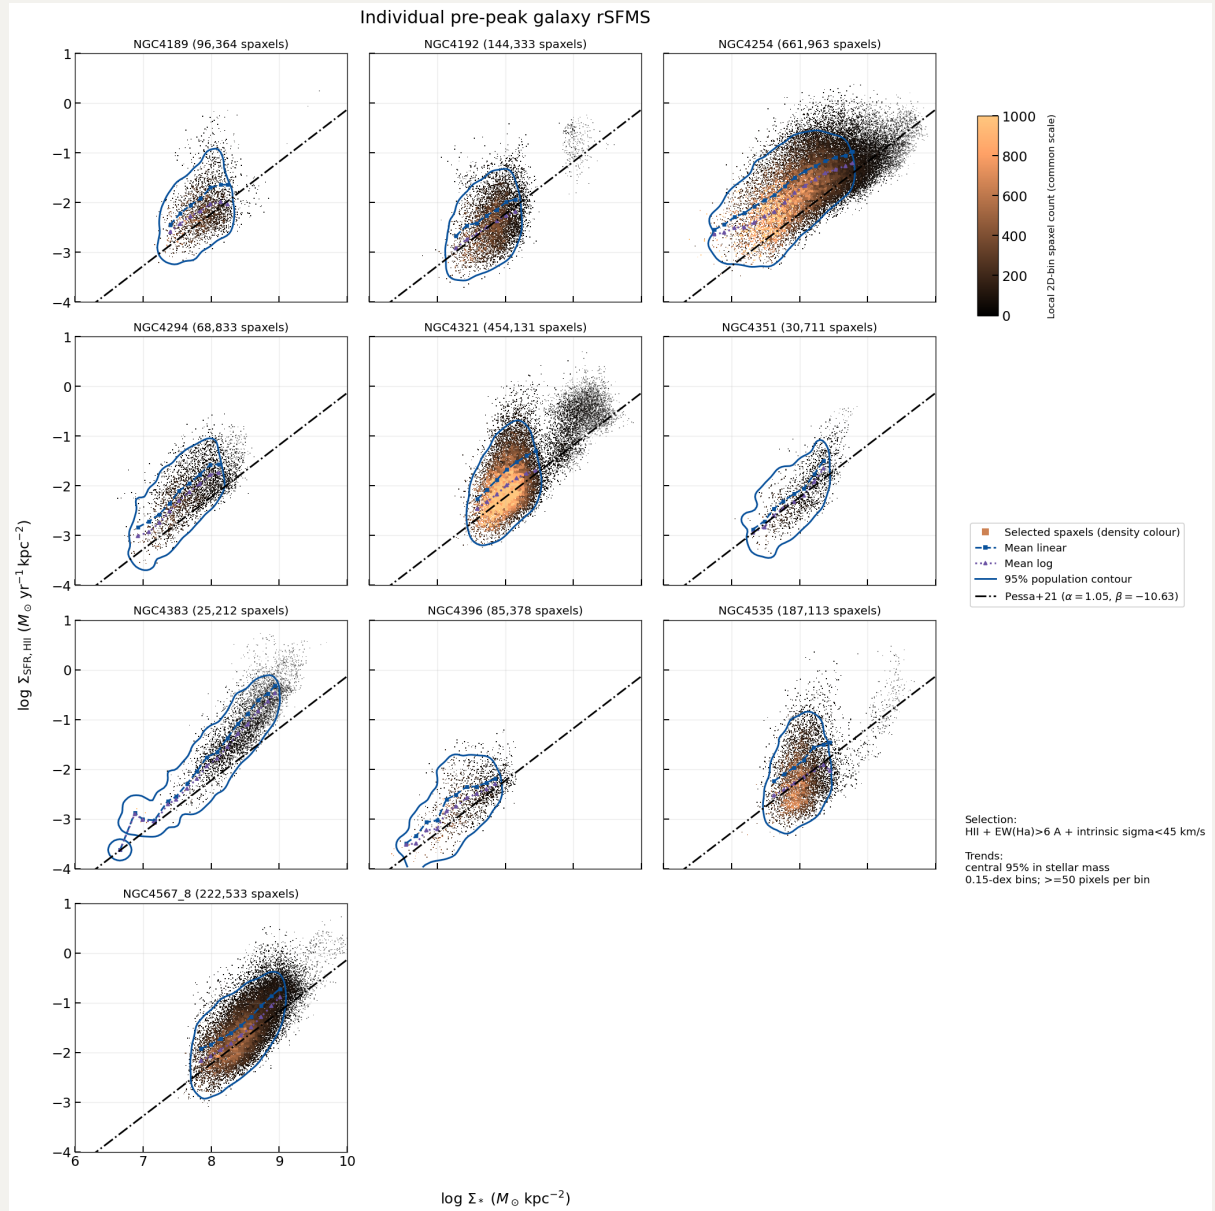

it seems that PHANGS rSFMS is more close to our "close-to-peak" and "post-peak" sample.
Or in other word, our pre-peak sample is more star-forming

but i suspect that that might be because that they dont perform the conservative SF
selection as ours

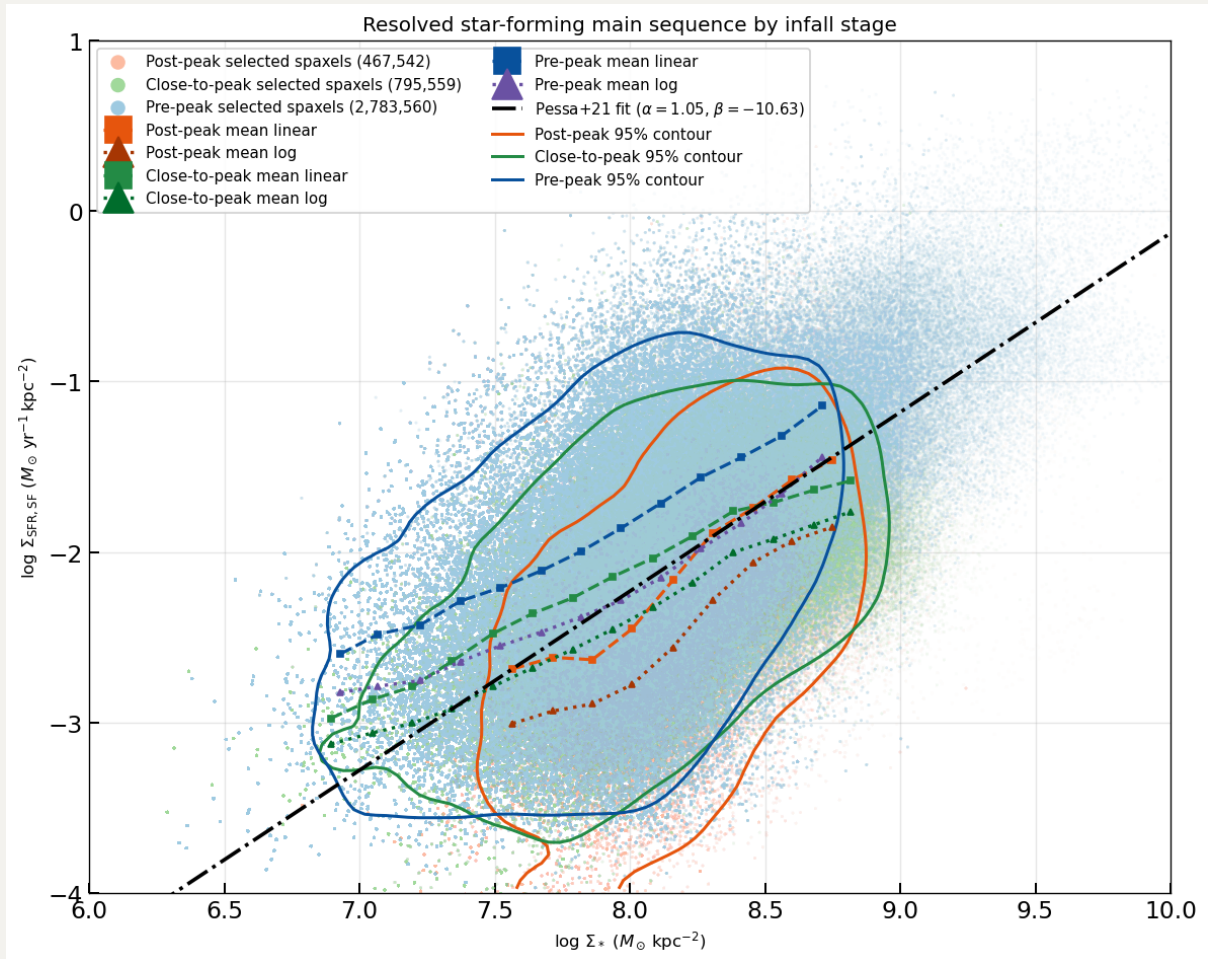

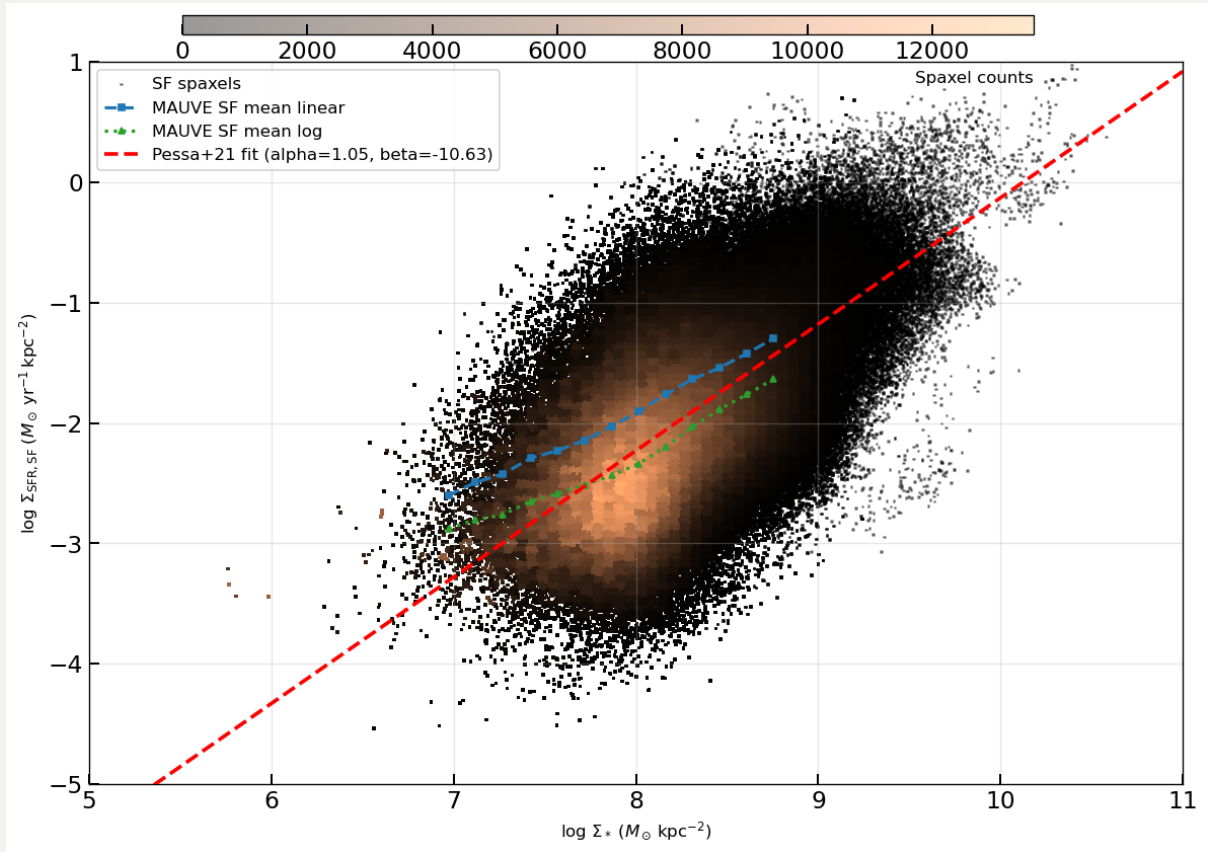

even those 3 phangs galaxies are still a bit SFR-enhanced (4535's mean-log aligns with Pessa21, but that fitting line is based on mean-linear)

However, if i perform Pessa21 selection (SF spaxel without EW and dispersion cut), then it looks more consistent with their fitting line. So there is not any significant enhancement across the sample...

Individual pre-peak galaxy rSFM
